Epigenetic mechanisms (DNA modifications, histone alterations and non-coding RNAs) are crucial for transcriptional regulation and alterations of the “physiological epigenome” are increasingly associated with human diseases. During the last decade the emerging field of neuroepigenomics have started to impact tremendously in areas such learning and memory, addiction or neurodegeneration. This expert volume covers the role of epigenetic molecular mechanism in regulation of central nervous system’s function, one of the most exciting areas of contemporary molecular neuroscience. The book describes the current knowledge on the epigenetic basis of human disease covering the complete lifespan: from neurodevelopment/childhood (Rett Syndrome, Rubinstein-Taybi, autism), adolescence (eating disorders, drug addiction, anxiety), adulthood (depression, schizophrenia, amyotrophic lateral sclerosis, Huntington’s disease) and elderly (Alzheimer’s disease, Parkinson’s disease). The book also covers the three major players on neuroepigenomic mechanisms: histones alterations, DNA modifications and non-coding RNAs, their roles at the molecular and cellular level and the impact of their alterations on neuronal function and behavior. Finally, a special chapter on state-of-the-art technologies helps the reader not only to understand epigenetic driven changes in human cognition and diseases but also the methodology that will help to generate paradigm shifts on our understanding of brain function and the role of the neuroepigenome in human diseases.

Rhetoric in the Flesh is the first book-length ethnographic study of the gross anatomy lab to explain how rhetorical discourses, multimodal displays, and embodied practices facilitate learning and technical expertise and how they shape participants’ perceptions of the human body. By investigating the role that discourses, displays, and human bodies play in the training and socialization of medical students, T. Kenny Fountain contributes to our theoretical and practical understanding of the social factors that make rhetoric possible and material in technical domains. Thus, the book also explains how these displays, discourses, and practices lead to the trained perspective necessary for expertise. This trained vision is constructed over time through what Fountain terms embodied rhetorical action, an intertwining of body-object-environment that undergirds all scientific, medical, and technical work. This book will be valuable for graduate and advanced undergraduate courses in technical and professional communication (technical communication theory and practice, visual or multimodal communication, medical technical communication) and rhetorical studies, including visual rhetoric, rhetoric of science, medical rhetoric, material rhetoric and embodiment, and ethnographic approaches to rhetoric.

The field of anatomy is dynamic and fertile. The rapid advances in technology in the past few years have produced exciting opportunities in the teaching of gross anatomy such as 3D printing, virtual reality, augmented reality, digital anatomy models, portable ultrasound, and more. Pedagogical innovations such as gamification and the flipped classroom, among others, have also been developed and implemented. As a result, preparing anatomy teachers in the use of these new teaching tools and methods is very timely. The main aim of the second edition of Teaching Anatomy - A Practical Guide is to offer gross anatomy teachers the most up-to-date advice and guidance for anatomy teaching, utilizing pedagogical and technological innovations at the forefront of anatomy education in the five years since the publication of the first edition. A fascinating exploration of the medical student's most decisive course -- gross anatomy -- and of the intellectual, emotional and spiritual transformation that turns young men and women into doctors Medical Gross and Developmental Anatomy is a course every medical student dreads. As one future physician told the author, Steve Giegerich, passing the notoriously difficult course is "paying your dues for medicine. It's the bridge you have to cross if you want to become a doctor." More students leave medical school during this course than any other. Now Body of Knowledge puts readers in the classroom as potential doctors come face-to-face with their first human cadaver and dissects the factors that determine whether they succeed or fail. In January 1999, 181 students at the University of Medicine and Dentistry, Newark, began a course in gross anatomy. Among them were Sherry Ikalowych, a former nurse and mother of four; Jennifer Hannum, an ultracompetitive jock; Udele Tagoe, a determined Duke graduate of Ghanaian descent; and Ivan Gonzalez, a Nicaraguan refugee and unlikely medical student. For these four lab partners, Tom Lewis, the cadaver lying on the stainless steel table, remains anonymous during dissection; but for the reader, Lewis springs to life. As the students grapple with love, hate, power and awe, Giegerich explores Lewis's life and his generous decision to donate his body to science. Ultimately, as the students gain reverence for medicine, they too develop gratitude for Lewis's thoughtful gift.
