third dimension to the model. The geometry of this three-dimensional model is called solid analytic geometry. You can construct a three-dimensional coordinate system by passing a z-axis perpendicular to both the x- and y-axes at the origin. Figure 11.1 shows the positive portion of each coordinate axis. Taken as pairs, the axes determine three

Analytic geometry of three and more dimensions. For example, Euler and Hermann showed that the equation $f(z) = x^2 + y^2$ gives the surface that is produced by revolving the curve $f(z) = x^2$ about the z-axis (see the figure, which shows the elliptic paraboloid $z = x^2 + y^2$).

Analytic geometry of three and more dimensions Although both Descartes and Fermat suggested using three coordinates to study curves and surfaces in space, three-

-dimensional analytic geometry developed slowly until about 1730, when the Swiss mathematicians Leonhard Euler and Jakob Hermann and the French mathematician Alexis Clairaut produced general equations for cylinders, cones, and surfaces of revolution.

We are going to study by algebraic methods the geometry of three dimensional real euclidean space, usually regarded as "ordinary" space. We adopt the elementary view of analytical geometry, according to which it is merely a matter of convenience to introduce the algebraic method as a tool for the solution of problems having a well-defined ...
