Building upon the success of previous editions of the bestselling Handbook of Laboratory Animal Science, first published in 1994, this latest revision combines all three volumes in one definitive guide. It covers the essential principles and practices of Laboratory Animal Science as well as selected animal models in scientific disciplines where much progress has been made in recent years. Each individual chapter focuses on an important subdiscipline of laboratory animal science, and the chapters can be read and used as stand-alone texts, with only limited necessity to consult other chapters for information. With new contributors at the forefront of their fields, the book reflects the scientific and technological advances of the past decade. It also responds to advances in our understanding of animal behavior, emphasizing the importance of implementing the three Rs: replacing live animals with alternative methods, reducing the number of animals used, and refining techniques to minimize animal discomfort. This fourth edition will be useful all over the world as a textbook for laboratory animal science courses for postgraduate and undergraduate students and as a handbook for scientists who work with animals in their research, for university veterinarians, and for other specialists in laboratory animal science.

Toxicology is a means to an important end: safety. The effective toxicologist begins with this in mind, and uses a clear understanding of safety as a relative concept, together with a rational view of the current safety evaluation paradigm to direct their work. Too often this approach is ignored or discouraged by traditional practice. This lucid, readable book encourages both experienced toxicologists and those in training to place toxicological investigation in such a framework. It looks at the importance of toxicological normality, reviews toxicity testing methods, and explores new and 'alternative' methods of safety evaluation. The interpretation of toxicity findings in individual studies and data packages and the prediction of human-relevant hazards are reviewed, followed by an introduction to risk and how we perceive and assess risk in the light of known hazards and the probability of their occurrence. The final stage of the toxicological process, risk assessment and management, is reviewed with particular reference to the work-place. A Guide to Practical Toxicology uses text boxes to give background information on specific subjects or to act as simple guides to toxicological method or process; this is supported by tables and case-studies intended to illustrate method, study design and interpretation. These features mean the book works at different levels, suitable for professional and student toxicologists as well as those from outside the field who require some knowledge of toxicological method and interpretation, for instance in occupational hygiene or medicine and veterinary surgery.

Clinical Biochemistry of Domestic Animals, Second Edition, Volume I, is a major revision of the first edition prompted by the marked expansion of knowledge in the clinical biochemistry of animals. In keeping with this expansion of knowledge, this edition is comprised of two volumes. Chapters on the pancreas, thyroid, and pituitary-adrenal systems have been separated and entirely rewritten. Completely new chapters on muscle metabolism, iron metabolism, blood clotting, and gastrointestinal function have been added. All the chapters of the first edition have been revised with pertinent new information, and many have been completely rewritten. This volume contains 10 chapters and opens with a discussion of carbohydrate metabolism and associated disorders. Separate chapters follow on lipid metabolism, plasma proteins, and porphyrins. Subsequent chapters deal with liver, pancreatic, and thyroid functions; the role of the pituitary and adrenal glands in health and disease; the function of calcium, inorganic phosphorus, and magnesium metabolism in health and disease; and iron metabolism.

The 2nd edition of The Handbook of Medicinal Chemistry is a carefully curated compilation of writing from global experts. Using their broad experience of medicinal chemistry, project leadership and drug discovery from both industry, academic and charity perspectives they are able to provide unparalleled insight into the field in a single, invaluable volume.

This title provides veterinary students and non-specialist with a case study base workbook which serves as a guide to effective use and interpretation of clinical chemistry laboratory methods in domestic animals. There are over 100 case studies involving real patients and findings in dogs, cats, horses, lamas, alpacas, pot belled pigs and ferrets. Case studies consist of patient history, physical examination findings, and clinicopathologic data such as CBC, urinalysis, cytology or fluid analysis. A summary is given for each patient that includes a description of follow up tests and response to treatment. Multiple cases of common diseases are included to illustrate the variety of clinicopathologic findings with the same diagnosis depending on individual patient factors. Diagnostic dilemmas in which different diseases may present with similar clinical signs and laboratory data are also included. Published by Teton New Media in the USA and distributed by Manson Publishing outside of North America.

A volume in the American College of Laboratory Animal Medicine series, this second edition has over 40% new material, including the addition of six new topics and many others that are completely rewritten. The book comprehensively covers the biological and disease aspects of laboratory animal medicine while examining other aspects such as the biohazards associated with the use of animal experimentation and factors complicating the bioethics of animal research.

10+ Years of Updates Since First Edition Newcomers to the animal clinical chemistry and toxicology fields quickly find that the same rules of human medicine do not always apply. Following in the footsteps of its standard-setting first edition, *Animal Clinical Chemistry: A Practical Handbook for Toxicologists and Biomedical Researchers, Second Edition* collates information widely dispersed in journals and book chapters, focusing on the most relevant literature to experimental toxicology and its distinction from human medicine. Expands Discussion of Troponins, Lipids, and Electrolytes In addition to tests recommended by regulatory authorities, this globally relevant resource includes information about clinical chemistry tests as well as hepato-, nephro-, cardio-, and endocrine toxicity. It also covers pre-analytical and analytical variables, which play a far more important role with interpreting data from animal studies as compared to human studies when variables can be well controlled with less physiological effect. Furthermore, this edition takes its discussion of biomarkers to the next level, exploring newer and related investigations, such as metabolomics/NMR and multiplex technology. Under the editorial guidance of G.O. Evans, a recognized field authority, the book presents background information on the selection and application of biochemical tests in preclinical safety assessment studies. It also assesses specific organ toxicity, such as in the liver, kidney, and thyroid, along with regulatory requirements and statistical approaches. Careful to avoid delving into overly complex detail, this text is a comprehensive, practical reference ideal for new entrants to the field. However, its broad scope and depth also make it suitable for more seasoned scientists and toxicologists.

Scientific experiments using animals have contributed significantly to the improvement of human health. Animal experiments were crucial to the conquest of polio, for example, and they will undoubtedly be one of the keystones in AIDS research. However, some persons believe that the cost to the animals is often high. Authored by a committee of experts from various fields, this book discusses the benefits that have resulted from animal research, the scope of animal research today, the concerns of advocates of animal welfare, and the prospects for finding alternatives to animal use. The authors conclude with specific recommendations for more consistent government action. A quick guide to appropriately selecting and interpreting laboratory tests, *Small Animal Clinical Diagnosis by Laboratory Methods, 5th Edition* helps you utilize your in-house lab or your specialty reference lab to efficiently make accurate diagnoses without running a plethora of unnecessary and low-yield tests. It provides answers to commonly asked questions relating to laboratory tests, and solutions to frequently encountered problems in small animal diagnosis. For easy reference, information is provided by clinical presentation and abnormalities, and includes hundreds of tables, boxes, key points, and algorithms. This edition, now in full color, is updated with the latest advances in laboratory testing methods and diagnostic problem solving. Written by noted educators Dr. Michael Willard and Dr. Harold Tvedten, this book may be used as an on-the-spot guide to specific problems or conditions as well as a reference for more detailed research on difficult cases. Concise discussions address laboratory approaches to various disorders, possible conclusions from various test results, artifacts and errors in diagnoses, and interpretations leading to various diagnoses. Hundreds of tables, boxes, algorithms, and key points offer at-a-glance information including cautions, common pitfalls, and helpful "pearls," and lead to proper differential and clinical diagnostic decision making. Note boxes identify key considerations in correlating clinical signs with test data for accurate diagnoses, highlight safety precautions, and offer helpful tips for sample preparation and interpretation. Chapters on laboratory diagnostic toxicology and therapeutic drug monitoring help in handling potentially fatal poisonings and other special situations. Expert editors and contributors provide clinical knowledge and successful diagnostic problem-solving solutions. A practical appendix lists referral laboratories that may be contacted for certain diseases, and reference values with the normal or expected range for coagulation, hematology, and more. Updated coverage integrates the newest advances in testing methods and diagnostic problem solving. Full-color pho-

tos and schematic drawings are placed adjacent to related text, and accurately depict diagnostic features on microscopic slide preparations as well as test procedures and techniques.

Hematology data from in vivo toxicology studies remains one of the most predictive measures for human risk, as the same measurements made in pre-clinical toxicology studies can be made in early clinical trials. Covering the three main blood cell types – erythrocytes, leukocytes and thrombocytes, this work is designed to clarify topics for new entrants to the fields of laboratory animal hematology and toxicology, especially those topics where the rules for human hematology do not always apply. An entire chapter is devoted to immunotoxicology, a scientific discipline that is closely aligned with hematology. The text also addresses pre-analytical and analytical variables that affect animal studies, as these play a far more important part when interpreting data in contrast to humans where many of these variables can be well controlled or have less physiological effect. Information has been collated from published papers, textbooks and unpublished data: Readers are provided with key references to encourage further study
