India has developed and possesses weapons of mass destruction in the form of nuclear weapons. Although India has not made any official statements about the size of its nuclear arsenal, recent estimates suggest that India has 130-140 nuclear weapons and has produced enough weapons-grade plutonium for up to

150-200 nuclear weapons. In 1999, India was estimated to have 800 kg of separated ...

India and weapons of mass destruction - Wikipedia

The easiest way to find the number of protons, neutrons, and electrons for an element is to look at the element's atomic number on the periodic table. That number is equal to the number of protons. The number of protons is equal to the number of electrons, unless there's an ion superscript listed after the element.

THE NUCLEAR ATOM Atomic model At the beginning of the 20th century, scientists knew that the atom contained positive and negative charges, but the structure was a great mystery. An experiment by Rutherford discovered what is now called Rutherford scattering. This effect was a surprising discovery, but one that

The atomic nucleus is the small, dense region consisting of protons and neutrons at the center of an atom, discovered in 1911 by Ernest Rutherford based on the 1909 Geiger-Marsden gold foil experiment. After the discovery of the neutron in 1932, models for a nucleus composed of protons and neutrons were quickly developed by Dmitri Ivanenko and Werner Heisenberg.

The Lorenz model has been widely used for exploring many real world problems. In this paper we obtain, with the help of an invariant manifold technique, the return map for the maximum value of the

Thorium-based nuclear power generation is fueled primarily by the nuclear fission of the isotope uranium-233 produced from the fertile element thorium. According to proponents, a thorium fuel cycle offers several potential advantages over a uranium fuel cycle—including

much greater abundance of thorium on Earth, superior physical and nuclear fuel properties, and reduced nuclear waste production.
