During the past twelve years, a course on critical care medicine has been sponsored by the Post Graduate Division of the University of Southern California School of Medicine in association with its

Center for the Critically Ill. The content of each of the symposia has paralleled the evolution of critical care medicine as a recognized service specialty. The annual program was planned as a teaching session for physicians and allied medical personnel who sought to advance their involvement in this rapidly advancing field. A panel of highly regarded authorities on subjects bearing on critical care medicine, faculty members of the USC School of Medicine, and staff members of our own Center for the Critically Ill at the Hollywood Presbyterian Medical Center serve as faculty of these symposia. Although the primary commitment of the organizers to maintain this as a teaching and demonstration session was not abandoned, the number of annual registrants progressively increased from fewer than 100 to more than 1200, gradually outstripping local hotel facilities in central Los Angeles. The symposium for the past two years has been held in the large and attractive Anaheim Convention Center adjacent to Disneyland.

A long time favorite, the fifth edition of BASIC CLINICAL LAB COMPETENCIES FOR RESPIRATORY CARE: AN INTEGRATED APPROACH continues to bring classroom theory to life at the bedside. Known for its integration of theoretical knowledge and practical skills, this text emphasizes the importance of assessment of need, contraindications, hazards/complications, monitoring, and outcomes assessment in respiratory care. Concise, direct, and easy to understand, this fifth edition has been updated to reflect recent advances in the field in order to ensure that students have the knowledge and skills needed to practice the art and the science of respiratory care. Important Notice: Media content referenced within the product description or the product text may not be available in the ebook version.

The second edition of this reader friendly text remains as the only one in its field describing how to assemble and troubleshoot the equipment used in the field of respiratory care. The book concentrates on the theory behind the various types of equipment and includes rationales that explain the necessity and function of the equipment in practice.

Medical Device Technologies introduces undergraduate engineering students to commonly manufactured medical devices. It is the first textbook that discusses both electrical and mechanical medical devices. The first 20 chapters are medical device technology chapters; the remaining eight chapters focus on medical device laboratory experiments. Each medical device chapter begins with an exposition of appropriate physiology, mathematical modeling or biocompatibility issues, and clinical need. A device system description and system diagram provide details on technology function and administration of diagnosis and/or therapy. The systems approach lets students quickly identify the relationships between devices. Device key features are based on five applicable consensus standard requirements from organizations such as ISO and the Association for the Advancement of Medical Instrumentation (AAMI). The medical devices discussed are Nobel Prize or Lasker Clinical Prize winners, vital signs devices, and devices in high industry growth areas. Three significant Food and Drug Administration (FDA) recall case studies which have impacted FDA medical device regulation are included in appropriate device chapters. Exercises at the end of each chapter include traditional homework problems, analysis exercises, and four questions from assigned primary literature. Eight laboratory experiments are detailed that provide hands-on reinforcement of device concepts.

The backbone of in-patient care is the hospital ward, and I believe that this will remain so in the future. Shortcomings in the staffing, organization and layout of the conventional ward have been recognized for a long time, but there have been few changes and not all these have benefited the patient. The evolution of specialized treatment centres for poliomyelitis, thoracic surgery, burns and so on, showed the need for a new staffing structure—a re-organization of patient care and of secondary importance, new forms of accommodation. These regional or referral centres serve large populations or areas and are collectively known as specialized intensive care (or therapy) units. The idea of using similar principles of staffing, organization and facilities to serve each large district hospital came much later (1959) and was first applied in the United States. Thus, the general intensive care unit was born, a unit which would treat critically ill patients irrespective of the nature of their disease, in sharp contrast to the specialized intensive care unit. The staffing structure and technologies of the two are however similar. Specialized intensive care consists of a single speciality or two specialities, for example thoracic surgery and thoracic anaesthesia. General intensive care cannot be a speciality because it embraces the whole of acute medicine, acute surgery, accident surgery, toxicology and many more individual specialities. This very diversity makes it difficult to organize, but interesting to perform.
