Highbush Blueberry Production - Penn State Extension

The philosophy behind blueberry pruning is to constantly renew the older, decreasingly productive canes by cutting them out and forcing new canes. The plant is continually replacing old canes with new canes, while the majority of the canes are in a productive, intermediate stage.

Highbush blueberry plants require annual dormant pruning. Pruning controls crop load, which increases fruit quality. It also invigorates the plant by stimulating new growth from the plant's base. Pruning is usually done toward the end of the dormant season (usually March) when fruit buds are easily recognizable.

Generally for blueberry plant pruning, you should remove the two oldest canes each winter. In the first two years, adequate pruning will help train blueberry bushes into the most desired shape for promoting maximum fruit production. When is the Best Time for Blueberry Plant Pruning? Pruning should be done annually, ...

CORVALLIS, Ore. - Moderate pruning of highbush blueberries done every year can make the difference between a mediocre and a bumper crop - and in consistent production of quality fruit. Highbush blueberry, a native of North America, grows six to 12 feet tall and is the major blueberry-producing species in commerce.

Pruning Blueberry Plants in Florida

Blueberry scorch, caused by Blueberry scorch virus (BIScV), is a serious disease that was first detected in B.C. in 2000 and has since become widespread in all blueberry production regions. BIScV can spread by as much as 5% annually in infected fields. Damage caused by BIScV can be severe, resulting in significant yield losses on infected plants.

Any pruning of blueberry bushes, especially mature bushes, is required for successful production of blueberries. Blueberry bushes that have not been pruned on an annual basis may become overgrown and less fruitful (Figure 1). Proper training of blueberries is essential to maintain plant size, shape and productivity.

Blueberries - Province of British Columbia

Pruning Blueberries - Information On Trimming Blueberry Bushes

Most blueberry bushes grown in home landscapes are upright, multi-stemmed deciduous bushes. The most common blueberry bushes are highbush and southern highbush, which can grow from 6 to 8 feet tall. No matter which type of blueberry bushes you have, they all need yearly pruning to manage their height and shape.

This, of course, means pruning. Understanding Blueberry Fruit Production. A blueberry bush grows canes which then produce branches and side-shoots. The fruit is produced on the tips of side-shoots which were new the previous year. (In essence, fruit is produced on year-old wood.) The most productive canes are around three years old.
