Poisoning is a far more serious health problem in the U.S. than has generally been recognized. It is estimated that more than 4 million poisoning episodes occur annually, with approximately 300,000 cases leading to hospitalization. The field of poison prevention provides some of the most celebrated examples of successful public health interventions, yet surprisingly the current poison control "system" is little more than a loose network of poison control centers, poorly integrated into the larger spheres of public health. To increase their effectiveness, efforts to reduce poisoning need to be linked to a national agenda for public health promotion and injury prevention. Forging a Poison Prevention and Control System recommends a future poison control system with a strong public health infrastructure, a national system of regional poison control centers, federal funding to support core poison control activities, and a national poison information system to track major poisoning epidemics and possible acts of bioterrorism. This framework provides a complete "system" that could offer the best poison prevention and patient care services to meet the needs of the nation in the 21st century.

Presents information about ten careers in health care, medicine and science that can be obtained through two-year degree programs.

This publication is a collection of the papers presented at the 'First International Course on Hemodialysis Technology', Vicenza, June 2002: It covers a wide range of topics, including aspects of vascular access and new forms of monitoring access function. Moreover, anticoagulation strategies and antimicrobial treatment are debated, with special emphasis on temporary catheters and prosthetic devices. Membrane composition and structure, their methods of sterilization and performance are discussed by experts and manufacturers, bringing together in a unique way science, theory and manufacturing procedures. The same synthesis is achieved with respect to hemodialyzers, adsorbent devices, dialysis techniques and machines. A new issue is the possibility of computer-assisted data collection and management: This subject is discussed by experts in electronic data management, together with managers of large dialysis networks, concentrating on matters of quality assurance and continuous quality improvement programs. Special attention is given to dialysate and water purity since this is the starting point for newer dialytic techniques such as online hemodiafiltration. Moreover, the results obtained from the IDOPPS study are incorporated into the discussion of different practice patterns and anemia management. Finally, future trends are explored including automatic sensors and biofeedback monitors. Covering various aspects of hemodialysis technology, this book will be a helpful tool for physicians and nurses, both for education and information.

For more than a generation haemodialysis has been the principal method of treating patients with both acute and chronic renal failure. Initially, developments and improvements in the system were highly technical and relevant to only a relatively small number of specialists in nephrology. More recently, as advances in therapy have demonstrated the value of haemofiltration in the intensive therapy unit and haemoperfusion for certain types of poisoning, the basic principles of haemodialysis have been perceived as important in many areas of clinical practice. In this volume, the potential advantages of bicarbonate haemo dialysis are objectively assessed, the technical and clinical aspects of both haemofiltration and haemoperfusion discussed and the continuing problems associated with such extra corporeal circuits analysed. All the chapters have been written by recognized experts in their field. The increasing availability of highly technical facilities for appropriately selected patients should ensure that the information contained in the book is relevant not only to nephrologists but to all practising clinicians. *ABOUT THE EDITOR* Dr Graeme R. D. Catto is Professor in Medicine and Therapeutics at the University of Aberdeen and Honorary Consultant Physician/Nephrologist to the Grampian Health Board. His current interest in transplant immunology was stimulated as a Harkness Fellow at Harvard Medical School and the Peter Bent Brighton Hospital, Boston, USA. He is a member of many medical societies including the Association of Physicians of Great Britain and Ireland, the Renal Association and the Transplantation Society.

While continuous ambulatory peritoneal dialysis (CAPD) has been the standard peritoneal procedure since the seventies, different schedules of automated peritoneal dialysis (APD) have emerged during the eighties. Today, APD is considered a valuable tool in the management of ESRD patients, together with CAPD and hemodialysis. However, despite its frequent use, APD has not yet been well assessed, and most pathophysiological and clinical studies on PD refer to CAPD. In this book, major experts in the field therefore discuss and evaluate the insights gained on APD up to now, presenting a comprehensive review of all experimental, technical and clinical aspects related to the various treatments grouped under the definition of APD. The recent developments presented are divided into four sections: membrane permeability, transport mechanisms and kinetic modeling applied to APD; prescription and adequacy of different APD treatment schedules; dialysis machines and solutions for APD, and, lastly, different clinical aspects such as the possibility to maintain APD program and residual renal function. Physicians involved in ESRD care, renal fellows and scientists both in the academic world and in the hospital setting will undoubtedly profit from this timely publication.

Praise for the previous edition: "... highly recommended for high school, public, and academic libraries."
