The pathogenesis of a disease is the biological mechanism (or mechanisms) that leads to a diseased state. The term can also describe the origin and development of the disease, and whether it is acute, chronic, or recurrent. The word comes from the Greek πάθος pathos ("suffering", "disease") and γένεσις genesis ("creation").

Medical Definition of Pathogenesis Medical Author: William C. Shiel Jr., MD, FACP, FACR Pathogenesis: The development of a disease and the chain of events leading to that disease.

Definition of pathogenesis Pathogenesis is a branch of pathology that is dedicated to analyzing the origin of a morbid State. Its purpose is to study the events that are triggered from the action of an etiological factor and which reach up to the manifestation of the disease.

The main difference between pathophysiology and pathogenesis is that pathophysiology describes the physiological process associated with a particular disease or injury whereas pathogenesis describes the development of the disease. Furthermore, etiology is the medical discipline that describes the causes or the origination of the disease.

Pathophysiology and pathogenesis are two similar terms used to explain the occurrence of a disease and related mechanisms and characteristics. Pathophysiology concerns the conditions observed during a disease state and the processes going on within an organism. Pathogenesis mainly focuses on the origin and development of a disease.

Pathophysiology The above pathogenic mechanisms result in the pathological changes found in COPD. These in turn result in physiological abnormalities—mucous hypersecretion and ciliary dysfunction, airflow obstruction and hyperinflation, gas exchange abnormalities, pulmonary hypertension, and systemic effects.

This section presents a definition of asthma, a description of the processes on which that definition is based—the pathophysiology and pathogenesis of asthma, and the natural history of asthma. Asthma is a common chronic disorder of the airways that involves a complex interaction of airflow obstruction, bronchial hyperresponsiveness and an underlying inflammation.
