A Speed test measures your ping, and download and upload speeds. Measuring the latter two is essential because most ISPs make separate promises for download and upload speeds. Usually, the download speed features prominently, but if you dig into the details, the ISP typically specifies a slower upload speed for each level.

At-Speed Test A second common type of fault model is called the “transition” or “at-speed” fault model, and is a dynamic fault model, i.e., it detects problems with timing. It is similar to the stuck-at model in

that there are two faults for every node location in the design, classified as slow-to-rise and slow-to-fall faults.

In testing a device, known inputs are applied to a device in known state, actual output is compared to predictable golden response. The term “At speed” means “at application speed”, as mentioned in Functional specifications of IC(Integrated Circuit...

First, test timing is more accurate when the test clocks exactly match the functional clocks. Secondly, the high-speed on-chip clocks reduce the ATE requirements, enabling use of a less sophisticated and, thus, less expensive tester. Figure 4 shows a design with a high-speed on-chip PLL. Providing internal PLL control for at-speed test has become a common practice for at-speed scan testing (Refs. 4 and 5). The most common technique for applying at-speed transition patterns is referred to as a broadside or launch-from-capture pattern type (Ref. 6), as shown in Figure 2 .
