Alternatively, cast-in-place concrete pier segments have been utilized for longer spans or in areas of high seismicity where a monolithic connection to the column provides a more economical substructure design. Precast concrete pier shells with cast-in-place diaphragms can be proposed as a substitute for cast-in-place pier segments. Pier shells are a hybrid of fully precast and cast-in place construction, and combine their typical advantages and disadvantages.

The precast segmental box bridges are typically 6-span continuous with span arrangement of 45m+4x60m+45m and constant beam depth of 3.2m [Figure 2]. The span depth ratio is 18.75. For span length greater than 60m and up to 80m, 4.2m height haunch segment is designed at pier to enhance the hogging moment capacity.
