Developing Service-Oriented Applications Using the Windows ...

In the field of software application development, service-oriented development of applications (or SODA) is a way of producing service-oriented architecture applications. Use of the term SODA was first used by the Gartner research firm. SODA represents one possible activity for company to engage in when making the transition to service-oriented architecture (SOA). However, it has been argued that an overreliance on SODA can reduce overall system flexibility, reuse, and business agility.

This section of the documentation provides information about Windows Communication Foundation (WCF), which is a unified programming model for building service-oriented applications. It enables developers to build secure, reliable, transacted solutions that integrate across platforms and interoperate with existing investments.

Developing Service Oriented Applications—A Case Study To exemplify the successful implementation of SOA in a typical Enterprise, we focus on the requirements of an Enterprise engaged in providing travel and related services. The goal is to present the business application scenario of the requirements of SOA for a travel services-based company.

But Java is another kind of a traditional technology which can be used to develop or build Service Oriented Architecture. The main aim of SOA is to develop a loose coupling between modules, and an application can be built where the modules are not coupled with one another too tightly.

One approach to developing service-oriented Web applications is to transform high-level business models to a composition language that implements business processes with Web services. Object-oriented analysis and design and UML-based dia-grams are typically used in the software development process. In this paper, we discuss the devel-

Learning how to develop great GUI applications required new tools, a new mindset, and new patterns and guidelines. Interestingly, the new APIs were a rather small part of this transition in user interface style. Likewise, I believe that SOAP will turn out to be a relatively small part of the transition to a service-oriented development style.

Developing Software in a Service-Oriented World

SOA is an architectural approach that aims at developing modular applications consisting of independent services, which fulfill a specific task and communicate with each other in concordance. Tech-spirited discusses the advantages and disadvantages of implementing a service-oriented architecture.

Service-oriented architecture (SOA) is a software development model for distributed application components that incorporates discovery, access control, data mapping and security features. SOA has two major functions.

What is service-oriented architecture (SOA)? - Definition ...

Service-oriented architecture aims to allow users to combine large chunks of functionality to form applications which are built purely from existing services and combining them in an ad hoc manner. A service presents a simple interface to the requester that abstracts away the underlying complexity acting as a black box.

Service-oriented architecture - Wikipedia

Service-oriented applications A service-oriented application is an application that is composed largely of services, which are often in a hierarchy. The topmost level contains one or more integration services, each of which controls a flow of activities, such as processing an applicant's request for insurance coverage.

Service-oriented architecture (SOA) overview

Service-oriented development provides the following benefits: Reuse —The ability to create services that are reusable in multiple applications. Efficiency —The ability to quickly and easily create new services and new applications using a combination of new and old services, along with the ability to focus on the data to be shared rather than the implementation underneath.

Web services enable you to develop applications that can expose or reach out to systems or application programming interfaces (APIs) mediated either by a network or by the Internet. One of the primary benefits of Web services is that they can bridge heterogeneous systems — those systems that, without these services, might exist in isolation.
