~~Distributed generation - Wikipedia~~

Distributed generation may serve a single structure, such as a home or business, or it may be part of a microgrid (a smaller grid that is also tied into the larger electricity delivery system), such as at a major industrial facility, a military base, or a large college campus.

Deploying distributed PV can reduce transmission line losses, in-

crease grid resilience, avoid generation costs, and reduce requirements to invest in new utility generation capacity. With proper equipment and calibration, distributed PV systems can also mitigate reliability issues experienced by providing standby capacity during electric utility disturbances or outages.

Distributed generation (DG) is also known as embedded or dispersed generation. DG is electricity generating plant that is con-

ected to a distribution network rather than the transmission network....

A distributed energy resource (DER) is a small-scale unit of power generation that operates locally and is connected to a larger power grid at the distribution level. DERs include solar panels, small natural gas-fueled generators, electric vehicles and controllable loads, such as HVAC systems and electric water heaters.
