Fourier analysis and distribution theory

Two important methods in analysis is differentiation and Fourier transformation. Unfortunately not all functions are differentiable or has a Fourier transform. The theory of distribution tries to remedy this by imbedding classical functions in a larger class of objects, the so called distributions (or general functions).

Distribution theory, a relatively recent mathematical approach to classical Fourier analysis, not only opened up new areas of research but also helped promote the development of such mathematical disciplines as ordinary and partial differential equations, operational calculus, transformation theory, and functional analysis.

CN) Note that any convex set satisfying this condition is necessarily absorbing in $C_c^k(U)$ $\{\displaystyle C_c^k(U)\}$. Since the topology of any topological vector space is translation-invariant, any TVS-topology is completely determined by the set of neighborhood of the origin. This means that one could actually define the canonical LF topology by declaring that a convex balanced subset ...
