 Dynamic SOQL refers to the creation of a SOQL string at run time with Apex code. Dynamic SOQL enables you to create more flexible applications. For example, you can create a search based on input from an end user or update records with varying field names. To create a dynamic SOQL query at run time, use the database query method, in one of the following ways.

Dynamic SOQL | Apex Developer Guide | Salesforce Developers
 Dynamic SOQL refers to the creation of a SOQL string at run time with Apex code. Sometimes we need to query data on the based of input from end users or update records with varying field names. Here to achieve this requirement we use dynamic Soql queries. To create a Dynamic Soql Query at run time, we use database query method.

How to write Dynamic Soql Query . - Himanshu Rana's Blog
 Dynamic SOQL refers to the creation of a SOQL string at run time

with Apex code. Dynamic SOQL enables you to create more flexible applications. For example, you can create a search based on input from an end user, or update records with varying field names. This is the major difference between soql and dynamic soql.

Difference between Static SOQL and Dynamic SOQL

SOQL IN Operator is used to fetch the data from the matched values specified in the the SOQL statement. SOQL IN operator is mainly used to compare a value to a list of values that have been specified, and it retrieves the records if it matches the values specified in the list.

Apex SOQL - SOQL IN Operator with example

Dynamic SQL is a programming technique that allows you to construct SQL statements dynamically at runtime. It allows you to create more general purpose and flexible SQL statement because the full text of the SQL statements may be unknown at compilation.

SQL Server Dynamic SQL - SQL Server Tutorial

Dynamic SOQL refers to the creation of a SOQL string at run time with Apex code. It allows you to create more dynamic components that adapt at runtime and avoid hard-coding outcomes.

Dynamic SOQL + Person Accounts = [] | by Dave Norris | Medium
 Dynamic SOQL query Salesforce for soql select all. SOQL is Salesforce Object Query Language for querying data in the Force.com platform. It is very much similar to SQL. But in SOQL, we can not query all fields from object. This statement is not

allowed in SOQL: select * from Account; But there is one trick to query all fields of Object in SOQL query.

Dynamic SOQL query select all fields in Salesforce ...

Dynamic SOSL refers to the creation of a SOSL string at run time with Apex code. Dynamic SOSL enables you to create more flexible applications. For example, you can create a search based on input from an end user, or update records with varying field names. To create a dynamic SOSL query at run time, use the search query method.

Dynamic SOSL | Apex Developer Guide | Salesforce Developers Support Dynamic SOQL "No Shadowing" Option. Development (Apex, LWC & VF) In our managed package, we make heavy use of Dynamic SOQL so that we can optimize our queries to be as efficient as possible at runtime. We use Dynamic SOQL to do things like limiting the fields that are queried based on what features are enabled.

Support Dynamic SOQL "No Shadowing" Option - Ideas ...

Increase support for binding expressions (those preceded by a colon) in dynamic SOQL to match that provided by static SOQL. Currently you can only perform basic bindings to variables in local scope. E.g. if you previously queried an you couldn't use :account.Id in a dynamic SOQL query.

Dynamic SOQL binding expression support to match static ...

Dynamic SOQL from Salesforce documentation. I will however discuss few ways and methods of using Dynamic SOQL and accessing the returned results in different scenarios that is not documented in the above link. Scenario 1: Fetching fields from the object queried on. Let's take an example of Account and Contact objects in Salesforce.

Dynamic SOQL in APEX (in a nutshell)

I have an array of strings i'd like to use in the IN clause of a dynamic soql query. if i wasn't building the string at runtime i could simply use (from the SF docs): String[] ss = new String[]{'a', 'b'}; Account[] aa = [SELECT Id FROM Account WHERE AccountNumber IN :ss]; however, as i'm building at runtime, i use the following (where operators ...
