### DSTA 2019 - Dynamical Systems - Theory and Applications

Dynamical systems theory has emerged in the movement sciences as a viable framework for modeling athletic performance. From a dynamical systems perspective, the human movement system is a highly intricate network of co-dependent sub-systems (e.g. respiratory, circulatory, nervous, skeletal-muscular, perceptual) that are composed of a large number of interacting components (e.g. blood cells ...

In mathematics, stability theory addresses the stability of solutions of differential equations and of trajectories of dynamical systems under small perturbations of initial conditions. The heat equation, for example, is a stable partial differential equation because small perturbations of initial data lead to small variations in temperature at a later time as a result of the maximum principle.

In Chapter 2 we carry out the development of the analogous theory for autonomous ordinary differential equations (local dynamical systems). Chapter 3 is a brief account of the theory for retarded functional differential equations (local semi-dynamical systems). Here the state space is infinite-dimensional and not locally compact.
