When your car's moving, air flows through the radiator to keep your engine's temperature 'normal'. But if you stop - in a summer traffic jam for example - your engine relies on its cooling fan to force air through the radiator. The fan's controlled by an electric thermostat.

Internal combustion engines are often cooled by circulating a liquid called engine coolant through the engine block, where it is heated, then through a radiator where it loses heat to the atmosphere, and then returned to the engine.

Antifreeze is added to the water in your engine's cooling system that lowers its freezing point (and raises its boiling point too). It's why the liquid in your radiator doesn't freeze when everything else seems to be! You can choose a concentrated coolant that needs to be mixed with water or a ready-mixed one that can be used immediately.

The engine coolant becomes hot itself and so is transferred to a radiator located at the front of the car. Veins in the radiator contain the hot coolant which air cools as the vehicle moves forward. Airflow through the veins is maintained by a fan if the vehicle becomes hot due to being stationary for long periods.

Engine coolant, also known as antifreeze, is mixed with water to keep the radiator from freezing in extreme cold and overheating in extreme heat. There are many different types of coolant, so it's important to know what variety is right for your car or truck.

The radiator is linked to the engine by rubber hoses, and has a top and bottom tank connected by a core a bank of many fine tubes. The tubes pass through holes in a stack of thin sheet-metal fins, so that the core has a very large surface area and can lose heat rapidly to the cooler air passing through it.

Radiator cleaner fluid will allow the engine to perform at its best by removing the old antifreeze which is no longer able to manage the non-corrosive components and renewing it with fresh liquid. Although many DIYers urge drivers to clean out their radiators with vinegar, this liquid could very easily damage the structure of the entire radiator and weaken it, leading to several more problems.
