Emergency management provides the coordination needed to develop an effective community response to disasters. This critical public safety function is typically performed in mobile command posts in the field and in the jurisdiction's emergency operations center. Preparing individuals who will work in these facilities to perform their tasks under emergency conditions requires effective and realistic exercise training. The Federal Emergency Management Agency provides a five model exercise design for progressive training of emergency management staffs. This study examines the history and theoretical basis for exercises. From this background, it suggests alternatives to these five models to provide greater flexibility in delivery, options for specialized training in decision making, exercises that will support all phases of emergency management, and options for increased realism. Among the alternatives suggested are Tactical Decision Games, What-If Exercises, Postal Exercises, and a variety of simulation tools. The book is accompanied by a detailed appendix that provides specific instructions for each exercise type.

This helpful guide includes: (1) more than 260 forms and resolutions; and (2) quick answers to your day-to-day operating and legal questions such as officers' functions and duties, formation and operation, personnel, financial, and contracts.

Emergency medical service represents more than 80 per cent of the response activity in emergency response agencies. The whole concept of EMS has undergone drastic changes and improvements over the past three decades. With the ongoing threat of deadly diseases, the methods once practiced to treat trauma victims are not necessarily the best, or safest, procedures. In this day and age, change is the only constant. This book is designed

to improve the quality of your EMS delivery.

On May 9, 2001, the Disclosure Project hosted a major event at

the National Press Club in Washington, D.C. This historic event had witness testimony from twenty to twenty-five military, intelligence, government, and corporate individuals involved with UFO projects over the past fifty years, who presented their information before a worldwide group of media correspondents. "Those of us who were military witnesses of UFO history showed official government documentation with detailed testimony. Our focus was and is on the facts and documents. Our purpose was and is to get the mainstream media and government officials to hear those facts and move us toward an honest congressional inquiry. We who came forward want to ban weapons from space and stop aggressively shooting down these space vehicles and their extraterrestrial occupants. We need to declassify the advanced electromagnetic propulsion systems in use by the secret government, start producing them for the world to use, and thereby help save this planet. The people who had been employed in agencies within the military and knew the truth about UFOs were sworn to secrecy. Now I am finally relieved to speak the truth. We military men who hold on to this knowledge are getting old and dying, and we want the truth to come out. We will either do it ourselves or leave it for our children and wives to do. Personally, I have told those on Capitol Hill that I am being led to do it by the aliens themselves. They have convinced me that it is time. They have been waiting on the government, and if the government does not come forward with the truth, then the aliens will take a more public role in disclosure."

Over the last three decades the process industries have grown very rapidly, with corresponding increases in the quantities of hazardous materials in process, storage or transport. Plants have become larger and are often situated in or close to densely populated areas. Increased hazard of loss of life or property is continually highlighted with incidents such as Flixborough, Bhopal, Chernobyl, Three Mile Island, the Phillips 66 incident, and Piper Alpha to name but a few. The field of Loss Prevention is, and continues to, be of supreme importance to countless companies, municipalities and governments around the world, because of the trend for

processing plants to become larger and often be situated in or close to densely populated areas, thus increasing the hazard of loss of life or property. This book is a detailed guidebook to defending against these, and many other, hazards. It could without exaggeration be referred to as the "bible" for the process industries. This is THE standard reference work for chemical and process engineering safety professionals. For years, it has been the most complete collection of information on the theory, practice, design elements, equipment, regulations and laws covering the field of process safety. An entire library of alternative books (and cross-referencing systems) would be needed to replace or improve upon it, but everything of importance to safety professionals, engineers and managers can be found in this all-encompassing reference instead. Frank Lees' world renowned work has been fully revised and expanded by a team of leading chemical and process engineers working under the guidance of one of the world's chief experts in this field. Sam Mannan is professor of chemical engineering at Texas A&M University, and heads the Mary Kay O'Connor Process Safety Center at Texas A&M. He received his MS and Ph.D. in chemical engineering from the University of Oklahoma, and joined the chemical engineering department at Texas A&M University as a professor in 1997. He has over 20 years of experience as an engineer, working both in industry and academia. New detail is added to chapters on fire safety, engineering, explosion hazards, analysis and suppression, and new appendices feature more recent disasters. The many thousands of references have been updated along with standards and codes of practice issued by authorities in the US, UK/Europe and internationally. In addition to all this, more regulatory relevance and case studies have been included in this edition. Written in a clear and concise style, Loss Prevention in the Process Industries covers traditional areas of personal safety as well as the more technological aspects and thus provides balanced and in-depth coverage of the whole field of safety and loss prevention. * A must-have standard reference for chemical and process engineering safety professionals * The most complete collection of information on the theory, practice, design elements, equipment and laws that pertain to process safety * Only single work to provide everything; principles, practice, codes, standards, data and references needed by those practicing in the field

This study examined emergency management certification programs in order to understand what the training requirements for state emergency management certification reveal about the core functions of emergency management as conducted by emergency managers working in local jurisdictions. Based on practices in the 23 certification programs managed by state emergency management agencies or professional associations at the time of the study, qualitative content analysis identified a range of core functions practiced by those programs that specified training requirements in terms of specific courses. The application of grounded theory techniques to interview data from certification program managers and state emergency management training officers in 50 states resulted in the development of the theory that training requirements are adopted to meet a variety of goals. These goals include those appropriate to perceived needs of the sponsoring organizations and individual emergency managers, as well as goals that seek to promote competent performance of emergency management tasks. The list of core functions identified in state-level certification programs generally agreed with a list of core functions developed from the literature, indicating that practitioners at the local, state, and federal level have a common understand-

ing of the essential tasks of the evolving profession of emergency management as performed in local jurisdictions.
