Not sure if this is an actual area, but as someone who works in numerical analysis it would be cool to see what the rigorous formation of the subject looks like. I'm mostly interested in it with relation to solutions of PDEs, but really any foundations material would be appreciated. Thanks

Numerical simulations were carried out with elastic modulus values of $E_{\text{Found}} = 10$ to 100 MPa and $E_{\text{Soil}} = 10$ to 50 MPa for the foundation and the backfill soils, respectively. The modulus of the backfill soil, located within one meter of the facing, was taken to be $0.5E_{\text{Soil}}$. This was done to capture the influence of the lighter compaction equipment close to the back of the wall which is ...
