Award-winning No.1 bestselling author Michael Connelly's ninth Bosch book. Hieronymus (Harry) Bosch has retired from the Los Angeles Police Department - but the discovery of a startling unsolved murder among his old case files means he cannot rest until he finds the killer. When he left the LAPD, Bosch took a file with him: the case of a production assistant murdered four years earlier during a movie set robbery. The LAPD thinks the stolen money was used to finance a terrorist training camp. Thoughts of the original murder victim were lost in the federal zeal, and when Bosch decides to reinvestigate, he quickly falls foul of both his old colleagues and the FBI. When the private investigation enables him to meet up with an old friend, shadows from his past come back to haunt him . . . As the complexity of automotive vehicles increases this book presents operational and practical issues of automotive mechatronics. It is a comprehensive introduction to controlled automotive systems and provides detailed information of sensors for travel, angle, engine speed, vehicle speed, acceleration, pressure, temperature, flow, gas concentration etc. The measurement principles of the different sensor groups are explained and examples to show the measurement principles applied in different types.

This fundamental work explains in detail systems for active safety and driver assistance, considering both their structure and their function. These include the well-known standard systems such as Anti-lock braking system (ABS), Electronic Stability Control (ESC) or Adaptive Cruise Control (ACC). But it includes also new systems for protecting collisions protection, for changing the lane, or for convenient parking. The book aims at giving a complete picture focusing on the entire system. First, it describes the components which are necessary for assistance systems, such as sensors, actuators, mechatronic subsystems, and control elements. Then, it explains key features for the user-friendly design of human-machine interfaces between driver and assistance system. Finally, important characteristic features of driver assistance systems for particular vehicles are presented: Systems for commercial vehicles and motorcycles.

The authors examine in detail the fundamentals and mathematical descriptions of the dynamics of automobiles. In this context, different levels of complexity are presented, starting with basic single-track models up to complex three-dimensional multi-body models. A particular focus is on the process of establishing mathematical models based on real cars and the validation of simulation results. The methods presented are explained in detail by means of selected application scenarios. In addition to some corrections, further application examples for standard driving maneuvers have been added for the present second edition. To take account of the increased use of driving simulators, both in research, and in industrial applications, a new section on the conception, implementation and application of driving simulators has been added.

This book takes a look at fully automated, autonomous vehicles and discusses many open questions: How can autonomous vehicles be integrated into the current transportation system with diverse users and human drivers? Where do automated vehicles fall under current legal frameworks? What risks are associated with automation and how will society respond to these risks? How will the marketplace react to automated vehicles and what changes may be necessary for companies? Experts from Germany and the United States define key societal, engineering, and mobility issues related to the automation of vehicles. They discuss the decisions programmers of automated vehicles must make to enable vehicles to perceive their environment, interact with other road users, and choose actions that may have ethical consequences. The authors further identify expectations and concerns that will form the basis for individual and societal acceptance of autonomous driving. While the safety benefits of such vehicles are tremendous, the authors demonstrate that these benefits will only be achieved if vehicles have an appropriate safety concept at the heart of their design. Realizing the potential of automated vehicles to reorganize traffic and transform mobility of people and goods requires similar care in the design of vehicles and networks. By covering all of these topics, the book

aims to provide a current, comprehensive, and scientifically sound treatment of the emerging field of "autonomous driving".

Contains three Harry Bosch novels. **THE BLACK ECHO:** A body found in a tunnel off Mulholland Drive looks like a routine drugs overdose case, but one new puncture wound amidst the scars of old tracks leaves LAPD detective Harry Bosch unconvinced. To make matters worse, Bosch recognises the victim: Billy Meadows was a fellow 'tunnel rat' in Vietnam. Bosch believes he let down Billy once before, so now he is determined to bring the killer to justice. **THE BLACK ICE:** When the body of a missing LAPD narcotics officer is found, rumours soon emerge that he had been selling a new drug called Black Ice from Mexico. The LAPD are quick to declare the death as a suicide, but Bosch is not so sure. Fighting an attraction to the cop's widow, Bosch starts his own maverick investigation, which soon leads him over the borders, and into a dangerous world of shifting identities and deadly corruption. **THE CONCRETE BLONDE:** When Bosch shot and killed Norman Church, he was convinced it marked the end of the search for one of the city's most bizarre serial killers. But four years later, Church's widow is taking Bosch to court, accusing him of killing the wrong man. To make matters worse, Bosch has just received a note, eerily reminiscent of the ones the killer used to taunt him with. As he battles to clear his name in court, Bosch faces a desperate race against time to find the killer...
