 Frequency domain is an analysis of signals or mathematical functions, in reference to frequency, instead of time. As stated earlier, a time-domain graph displays the changes in a signal over a span of time, and frequency domain displays how much of the signal exists within a given frequency band concerning a range of frequencies.

*Introduction: Frequency Domain Methods for Controller Design*  
 The Frequency Domain. As discussed in the second page of this textbook, RF development makes extensive use of frequency-domain analysis. We can inspect and evaluate a real-life modulated signal by measuring it with a spectrum analyzer, but this means that we need to know what the spectrum should look like.

 It is a matter of mathematical convenience to translate signals from the time domain into the frequency domain with the Fourier Transform (or the closely related Laplace Transform), solve the problem at hand using Bode plots and other frequency domain analysis tools, then transform results back into the time domain.
