Fundamentals of Object Tracking tells you how. Starting with the generic object tracking problem, it outlines the generic Bayesian solution. It then shows systematically how to formulate the major tracking problems - maneuvering, multi-object, clutter, out-of-sequence sensors - within this Bayesian framework and how to derive the standard tracking solutions.

Fundamentals of Object Tracking (□□)

The typical objectives of object tracking are the determination of the number of objects, their identities and their states, such as positions, velocities and in some cases their features. A typical example of object/target tracking is the radar tracking of aircraft.

Introduction to object tracking

Motion tracking. By aligning the pose of the virtual camera that renders your 3D content with the pose of the device's camera provided by ARCore, developers are able to render virtual content from the correct perspective. The rendered virtual image can be overlaid on top of the image obtained from the device's camera,...

Object tracking is the process of: Taking an initial set of object detections (such as an input set of bounding box coordinates) Creating a unique ID for each of the initial detections; And then tracking each of the objects as they move around frames in a video,

maintaining the assignment of unique IDs
