We begin this chapter with discussing the type of elementary fuzzy partial differential equation we wish to solve. As in Chapter 3, 4, 7 and 8 we then consider types of solutions. If one fuzzifies the crisp partial differential equation and then solves, you are attempting to get the classical solution . is the topic of the second section.

In this paper, we consider intuitionistic fuzzy partial functional differential equations with local and nonlocal initial conditions using the Banach fixed point theorem. A new complete intuitionistic fuzzy metric space is proposed to investigate the existence and uniqueness of intuitionistic fuzzy solutions for these problems.

The study of fuzzy differential equations (FDEs) forms a suitable setting for the mathematical modelling of real world problems in which uncertainty or vagueness pervades. Fuzzy differential equations were first formulated by Kaleva [4,5]. He used the concept

An Implicit Method for Solving Fuzzy Partial Differential ...

Fuzzy Differential Equations (FDEs) model have wide range of applications in many branches of engineering and in the field of medicine.

Fuzzy equations are a widespread problem in many applied fields, such as production planning, optimization decision, and artificial intelligence, in which establishing general and operable solving... Study of fuzzy partial differential equations means the generalization of partial differential equations in fuzzy sense. While doing modelling of real situation in terms of partial differential equation, we see that the variables and parameters involve in the equations are uncertain (in the sense that they are not completely known or inexact or imprecise).

In developing a solution to a Fuzzy partial differential equation (FPDE) by Fuzzy separation of variables, one assumes that it is possible to separate the contributions of the fuzzy independent variables into Fuzzy separate functions that each involves only one fuzzy independent variable.

Introduction to fuzzy partial differential equations ...

The book presents important steps in this direction by introducing fuzzy partial differential equations and relational equations. It provides a unique opportunity for soft computing researchers and oil industry practitioners to understand the significance of the changes in the fields by presenting recent accomplishments and new directions.

Fuzzy equations are the equations whose parameters can be varied from the form of the fuzzy set. When the parameters or states of the differential equations are vague, they can as well be modeled with FDEs. The solutions of the fuzzy equations can be implemented directly for modeling as well as nonlinear control.

$$x(t) = \alpha(A - I)^n [t(A - I)^n + I]n$$

The paper is devoted to a fuzzy approach to numerical solutions of partial differential equations. Three main types of partial differential equations have been considered to demonstrate the algorithms with help of the fuzzy transform. We have introduced an example of a reasonable application of the
