There has been an exponential increase in desalination capacity both globally and nationally since 1960, fueled in part by growing concern for local water scarcity and made possible to a great extent by a major federal investment for desalination research and development. Traditional sources of supply are increasingly expensive, unavailable, or controversial, but desalination technology offers the potential to substantially reduce water scarcity by converting the almost inexhaustible supply of seawater and the apparently vast quantities of brackish groundwater into new sources of freshwater. Desalination assesses the state of the art in relevant desalination technologies, and factors such as cost and implementation challenges. It also describes reasonable long-term goals for advancing desalination technology, posits recommendations for action and research, estimates the funding necessary to support the proposed research agenda, and identifies appropriate roles for governmental and nongovernmental entities.

In cinema studies today, rarely do we find a direct investigation into the culture of capitalism and how it has been refracted and fabricated in global cinema production under neoliberalism. However, the current economic crisis and the subsequent Wall Street bailout in 2008 have brought about a worldwide skepticism regarding the last four decades of economic restructuring and the

culture that has accompanied it. In this edited volume, an international ensemble of scholars looks at neoliberalism, both as culture and political economy, in the various cinemas of the world. In essays encompassing the cinemas of Asia, Africa, Latin America, Europe, and the United States the authors outline how the culture and subjectivities engendered by neoliberalism have been variously performed, contested, and reinforced in these cinemas. The premise of this book is that the cultural and economic logic of neoliberalism, i.e., the radical financialization and market-driven calculations, of all facets of society are symptoms best understood by Marxist theory and its analysis of the central antagonisms and contradictions of capital. Taking a variety of approaches, ranging from political economy, ideological critique, the intersection of aesthetics and politics, social history and critical-cultural theory, this volume offers a fresh, broad-based Marxist analysis of contemporary film/media. Topics include: the global albeit antagonistic nature of neoliberal culture; the search for a new aesthetic and documentary language; the contestation between labor and capital in cultural production; the political economy of Hollywood, and questions of gender, sexuality, and the nation state in relation to neoliberalism.

For thousands of years, humans coped with heat by harvesting and storing natural ice and devising natural cooling systems that utilized ventilation and evaporation. By the mid 1800s, people began developing huge refrigeration machines to manufacture ice. By the early 1900s, engineers developed electric domestic refrigerators, which by 1927 were affordable convenient household appliances. By then, an increasingly sophisticated public demanded more modern-looking appliances than engineers could produce, and a new breed of designers entered the manufacturing world to provide them. During the Depression, modern designs not only increased sales but resulted in the kitchen appliances we now use. Today refrigeration preserves perishable food for worldwide distribution, makes tropical climates habitable for millions, saves lives with medical applications and enables space flight.
