Many international obligations are subject to exceptions. These can be expressed in several ways: an obligation may be vitiated by the presence of one of its constitutive negative requirements, an obligation may be set aside by the application of another more specific rule, or an actor might have a right to act in a certain way notwithstanding a contrary obligation. Exceptions are also of fundamental practical importance: for example, they affect the allocation of the burden of proof. This volume provides a systematic and analytic study of exceptions to legal obligations in international law and defences for breaches of these obligations. It features contributions written by legal philosophers, who introduce various theoretical approaches to the role of exceptions, and scholars of international law, who elaborate on generic issues applicable to exceptions in international law as well as examine specific issues arising from exceptions in their respective areas of expertise. Topics covered include the use of force, international criminal law, human rights, trade, investment, environment, and jurisdictional immunities.

The first comprehensive study of the distinction between justification and excuse under the international law of state responsibility.

Tracing the development of international law from regulating bilateral state-to-state relationships towards the promotion of the international community and the protection of human rights, this book, dedicated to the work of Judge Bruno Simma, forms a significant contribution to the theory and practice of international law.

Economic, social, and cultural rights are protected by an international covenant, recently amended by the optional protocol which allows individuals to bring rights violations before a UN committee. This book addresses how successfully these rights are implemented and safeguarded worldwide, assessing the key challenges to their protection.

"Seventy Years of the International Law Commission: Drawing a Balance for the Future" brings together voices from academia and practice to celebrate and critically evaluate the work of the United Nations International Law Commission (ILC) over the past seventy years. The edited volume draws on the events commemorating the seventieth anniversary of the Commission, which took place in New York and Geneva in May and July 2018. At a time when multilateral law-making has become increasingly challenging, the edited volume appraises the role of one of the most important driving forces behind the codification of international law and discusses the ILC's future contribution to the development of international law"--

Age discrimination is a highly topical issue in all industrialised societies, against a background of concerns about shortening working lives and ageing populations in the future. Based upon detailed research, and adopting an interdisciplinary approach, this unique study traces the history of the age discrimination debate in Britain and the USA since the 1930s. It critically analyses the concepts of ageism in social relations and age discrimination in employment. Case-studies on generational equity and health care rationing by age are followed by an analysis of the British government's initiatives against age discrimination in employment. The book then traces the history of the debate on health status and old age, addressing the question of whether working capacity has improved sufficiently to justify calls to delay retirement and extend working lives. It concludes with a detailed examination of the origins and subsequent working of the USA's 1967 Age Discrimination in Employment Act.

In this definitive study, Lawrence J. LeBlanc examines the nearly forty-year struggle over ratification of the Genocide Convention by the United States. LeBlanc's analysis of the history of the convention and the issues and problems surrounding its ratification sheds important light on the process of treaty ratification in the United States and on the role of American public opinion and political culture in international human rights legislation. Drawing on case studies of genocide committed since World War II, the author also confronts the strengths and weaknesses of international adjudication as a whole. Adopted by the United Nations General Assembly in 1948 in response to the atrocities committed by the Nazis before and during World War II, the Genocide Convention was finally made law by the United States Senate in 1988 contingent upon a series of "conditions"—known as the "Lugar-Helms-Hatch Sovereignty Package"—which, LeBlanc suggests, markedly weakened the convention. Through careful analysis of the bitter debates over ratification, LeBlanc demonstrates that much of the opposition to the convention sprang from fears that it would be used domestically as a tool by groups such as blacks and Native Americans who might hold the U.S. accountable for genocide in matters of race relations.

This book is the first comprehensive account of the International Labour Organization's 100-year history. At its heart is the concept of global social policy, which encompasses not only social policy in its national and international dimensions, but also development policy, world trade, international migration and human rights. The book focuses on the ILO's roles as a key player in debates on poverty, social justice, wealth distribution and social mobility subjects and as a global forum for addressing these issues. The study puts in perspective the manifold ways in which the ILO has helped structure these debates and has made - through its standard-setting, technical cooperation and myriad other activities - practical contributions to the world of work and to global social policy.

This book analyzes how the European Court of Human Rights (ECtHR) and the Inter-American Court of Human Rights (IACtHR) deal with general international law. In light of the concerns of various authors about the fragmentation of international law and the "human rightist" aspirations of human rights law, the question arises whether these human rights courts put the unity of general international law into danger. The main idea of this study is

that the ECtHR and the IACtHR may, in principle, only "elaborate" and not "depart" from or "contradict" general international law. A departure is only acceptable if a clear *lex specialis* has been established for human rights law. The author researches whether or not the sometimes different case law of both human rights courts fits into this assumption. Almost all topics of general international law that have been dealt with by the ECtHR and IACtHR are analyzed, including: reservations * application of treaties * *ratione temporis*, *ratione loci*, and *ratione personae* * interpretation rules * the theory of the sources of international law * *jus cogens* * modification and withdrawal from treaties * diplomatic protection * exhaustion of local remedies * state responsibility (including the law of reparations) * foreign state immunity * state succession. This volume will be of interest not only to human rights lawyers, but to all international lawyers. It explains how certain traditional concepts of general international law appear to function, and how other concepts need to be refined in order to create a more effective international order. This analysis may be a source of inspiration for other subsystems of international law like environmental law, WTO law, maritime law, space law, etc.

The goal of acceptable quality, cost, and time is a decisive challenge in every engineering development process. To be familiar with metrology requires choosing the best combination of techniques, standards, and tools to control a project from advanced simulations to final performance measurements and periodic inspections. This book contains a cluster of chapters from international academic authors who provide a meticulous way to discover the impacts of metrology in both theoretical and application fields. The approach is to discuss the key aspects of a selection of untraditional metrological topics, covering the analysis procedures and set of solutions obtained from experimental studies.

One of the most cited books in physics of all time, Quantum Computation and Quantum Information remains the best textbook in this exciting field of science. This 10th anniversary edition includes an introduction from the authors setting the work in context. This comprehensive textbook describes such remarkable effects as fast quantum algorithms, quantum teleportation, quantum cryptography and quantum error-correction. Quantum mechanics and computer science are introduced before moving on to describe what a quantum computer is, how it can be used to solve problems faster than 'classical' computers and its real-world implementation. It concludes with an in-depth treatment of quantum information. Containing a wealth of figures and exercises, this well-known textbook is ideal for courses on the subject, and will interest beginning graduate students and researchers in physics, computer science, mathematics, and electrical engineering.

This dissertation analyzes whether or not the principle of systemic integration - as expounded in Article 31(3)(c) of the Vienna Convention on the Law of Treaties - contributes to attainment of a coherent international legal system. For this purpose, the book considers three general ideas: the "unity" of the international legal system and fragmentation; the general rule on treaty interpretation and the principle of systemic integration; and the role of systemic integration in the achievement of coherence. Each one involves specific issues and considerations which ultimately assist in addressing the main question as to the usefulness of the principle in the curtailment of fragmentation in the international legal system. An authorised reissue of the long out of print classic textbook, Advanced Calculus by the late Dr Lynn Loomis and Dr Shlomo Sternberg both of Harvard University has been a revered but hard to find textbook for the advanced calculus course for decades. This book is based on an honors course in advanced calculus that the authors gave in the 1960's. The foundational material, presented in the unstarred sections of Chapters 1 through 11, was

normally covered, but different applications of this basic material were stressed from year to year, and the book therefore contains more material than was covered in any one year. It can accordingly be used (with omissions) as a text for a year's course in advanced calculus, or as a text for a three-semester introduction to analysis. The prerequisites are a good grounding in the calculus of one variable from a mathematically rigorous point of view, together with some acquaintance with linear algebra. The reader should be familiar with limit and continuity type arguments and have a cer-

tain amount of mathematical sophistication. As possible introductory texts, we mention Differential and Integral Calculus by R Courant, Calculus by T Apostol, Calculus by M Spivak, and Pure Mathematics by G Hardy. The reader should also have some experience with partial derivatives. In overall plan the book divides roughly into a first half which develops the calculus (principally the differential calculus) in the setting of normed vector spaces, and a second half which deals with the calculus of differentiable manifolds.
