An internal combustion engine (ICE) is a heat engine in which the combustion of a fuel occurs with an oxidizer (usually air) in a combustion chamber that is an integral part of the working fluid flow circuit. In an internal combustion engine, the expansion of the high-temperature and high-pressure gases produced by combustion applies direct force to some component of the engine.

Internal combustion (IC) engines operating on fossil fuel oil provide about 25% of the world's power (about 3000 out of 13,000 million tons oil equivalent per year—see Figure 1), and in doing so, they produce about 10% of the world's greenhouse gas (GHG) emissions (). Reducing fuel consumption and emissions has been the goal of engine researchers and manufacturers for years, as can be ...

Internal and external combustion engines are two types of heat engines: they convert thermal energy into mechanical energy. The main difference between internal and external combustion engine is that in internal combustion engines, the working fluid burns inside the cylinder, whereas in external combustion engines, combustion takes place outside the cylinder and heat is then transferred to the ...

The Wankel engine has the advantages of compact design and low weight over the more common internal combustion engine, which employs reciprocating pistons. These advantages give rotary engine applications in a variety of vehicles and devices, including automobiles, motorcycles, racing cars, aircraft, go-karts, jet skis, snowmobiles, chainsaws, and auxiliary power units.

Internal combustion engines can be divided into two categories: continuous-combustion engines and intermittent-combustion engines. The continuous-combustion engine is characterized by a steady flow of fuel and air into the engine and a stable flame maintained within the engine. Gas turbine engines exemplify the continuous-combustion engine.

Internal-combustion engine, any of a group of devices in which combustion's reactants (oxidizer and fuel) and products serve as the engine's working fluids. Work results from the hot gaseous combustion products acting on the engine's moving surfaces, such as the face of a piston, a turbine blade, or a nozzle.
