This paper presents an overview of the current state of auditing in Russia. International Standards on Auditing (ISA) are in the pro-

cess of being adopted and implemented but this task is far from complete. Furthermore, there is resistance to ISA adoption and there is less than a widespread perception that they are needed or desirable. Russia has adopted some auditing rules that are not included in ISA and the focus of audits in many companies is tax compliance or minimization rather than attestation. Lack of full compliance with ISA makes it more difficult to attract investment capital, since foreign investors do not place much confidence in financial statements that do not comply with International Accounting Standards and that were not audited using ISA.

Genetic erosion is the loss of genetic diversity within a species. It can happen very quickly, due to catastrophic events, or changes in land use leading to habitat loss. But it can also occur more gradually and remain unnoticed for a long time. One of the main causes of genetic erosion is the replacement of local varieties by modern varieties. Other causes include environmental degradation, urbanization, and land clearing through deforestation and brush fires. In order to conserve biodiversity in plants, it is important to target three independent levels that include ecosystems, species and genes. Genetic diversity is important to a species' fitness, long-term viability, and ability to adapt to changing environmental conditions. Chapters in this book are written by leading geneticists, molecular biologists and other specialists on relevant topics on genetic erosion and conservation genetic diversity in plants. This divisible set of two volumes deals with a broad spectrum of topics on genetic erosion, and approaches to biodiversity conservation in crop plants and trees. Volume 1 deals with indicators and prevention of genetic erosion, while volume 2 covers ge-

netic diversity and erosion in a number of plants species. These two volumes will also be useful to botanists, biotechnologists, environmentalists, policy makers, conservationists, and NGOs working to manage genetic erosion and biodiversity.

A summary is presented of a research program aimed at the improvement of high-temperature strain gages of the electrical resistance type. Potential ceramic and metal components were eval-

uated and a gage was devised that was based on these evaluations. This gage (NBS 5B) was flexible and easy to install; however, it lacked resistance stability at higher temperatures. In an attempt to minimize this deficiency, ceramic cements were developed that showed greater electrical resistivity than had been previously observed in the range 800 to 1800 degrees Fahrenheit; also, a technique was devised for increasing the resistance to ground by applying a fired-on ceramic coating to the grid of a specifically developed unbacked gage. A study was made of the cause of the erratic response of cemented gages that had not been preheated prior to use. There were strong indications that the erratic response was caused mostly by the rapid decrease in resistance that accompanied structural changes in the cement.

Resilience has become a central concept in government policy understandings over the last decade. In our complex, global and interconnected world, resilience appears to be the policy 'buzzword' of choice, alleged to be the solution to a wide and ever-growing range of policy issues. This book analyses the key aspects of resilience-thinking and highlights how resilience impacts upon traditional conceptions of governance. This concise and accessible book investigates how resilience-thinking adds new insights into how politics (both domestically and internationally) is understood to work and how problems are perceived and addressed; from educational training in schools to global ethics and from responses to shock events and natural disasters to long-term international policies to promote peace and development. This book also raises searching questions about how resilience-thinking influences the types of knowledge and understanding we value and challenges traditional conceptions of social and politi-

cal processes. It sets forward a new and clear conceptualisation of resilience, of use to students, academics and policy-makers, emphasising the links between the rise of resilience and awareness of the complex nature of problems and policy-making.

This title looks at what kind of responses Paul made to the Roman Empire. The author subjects the methods of current interpreters to critical scrutiny and discusses what makes an anti-imperial interpretation of Pauline writings difficult.

Highlighting more than a decade of research, this one-of-a-kind reference reviews the production, processing, and characteristics of a wide range of materials utilized in the modern tire and rubber industry. Rubber Compounding investigates the chemistry and modification of raw materials, elastomers, and material compounds for optimal formulation an

It was our intention to organize IAIT 2010 as the place where researchers and industrial practitioners could share their work and achievements in information technology, both theoretical and in application. This is the fourth time we have organized IAIT to serve as a venue to foster collaboration among industry and academia from different parts of the world. A lot has been achieved since the launch of the first IAIT in 2005; however, many challenges remain to be addressed in the years to come. IAIT 2010 drew attendance from leading professionals in both industry and academes, as in IAIT 2009. In addition to the relevant program offered by IAIT 2010, the conference provided an excellent environment to meet peers in the IT profession, build relationships, and exchange lessons learned. During the conference, participants presented and discussed the latest topics in information

technology, ranging from technical knowledge and experimentation to future strategic directions. As the Internet continues to reach out even further, almost everything in our daily life is accessible via IP addresses, our societies need to recognize that we need new knowledge to make this advancement become a benefit to all life in this world. It is almost impossible to gain this new knowledge without contributions from our colleagues, working in various aspects of information technology. Some times, new knowledge found in one area can help simplify difficult task

in another. Together we can make our world better by creating applications from information technology.

New Ideas addresses the problem and process of change in psychoanalysis from historical, theoretical, and clinical perspectives. Each section of the book is enriched by inclusion of a seminal historical paper (by M. Gitelson, P. Greenson, H. Hartmann, S. Lorand, and L. Stone), inviting the reader to compare integrative attempts of the past with those of the present.
