Solution: For the temperature at the bounce to be greater than 10 10 K, the value of a at the bounce a_b must be less than 10 10 [cf. (18.26)]. For simplicity let us suppose that the bounce occurs when the temperature is exactly 10 10 K corresponding to a redshift z of approximately 310 9 and an a_b 310 10 .

Relativistic gravity is also important on the smallest scales considered in contemporary physics — those of quantum gravity. These are characterized by the Planck length $l_{Pl} = (G\hbar/c^3)^{1/2} \sim 10^{-33}\text{cm}$. (2.3) This is much, much smaller than even the scale of the strong interactions $\sim 10^{-13}\text{cm}$. Yet, this is the scale which many
