Go on the trip of a lifetime. Two Wheels South shows you how to realize your own journey. Two friends take the motorcycle trip of their life--From Brooklyn to Patagonia. Matias Corea shares his insights on how to prepare, choose the right motorcycle, what to pack, how to plan the route, where to camp and last but not least: How to prepare your mind. Setbacks and breaking down are part of the adventure, but preparation and being on the road teach you the confidence to tackle any problem. Follow Matias Corea and his friend Joel through the American South, Central America over the Darien Gap and beyond, over wooden cracking jungle bridges in Colombia and to dry lake high plateaus in Argentina. Feel the character of the roads and the smell of nature: Riding a motorcycle is one of the purest forms of traveling. After 7 months and 13 countries Matias and Joel have learned a lot while riding down south on their trusty BMW air-cooled G / S overland haulers and are ready to share their experience. Two Wheels South invites you on the experience of a lifetime.

This work consists of a systematic catalogue and primary bibliography of the living Bivalvia of the eastern Pacific Ocean from Bering Strait, Alaska (66 deg N) to Cape Horn, Tierra del Fuego (60 deg S). 1308 species from the high intertidal zone to deep waters extending approximately two thousand kilometers offshore are included, representing the total described fauna. Also presented are the thermal range and fossil occurrence in the region, abstracted from the literature and collections.

This volume represents the published proceedings of an international conference on the Neurobiology and Evolution of the Mechanosensory Lateral Line System held August 31 to September 4, 1987, at the Center for Interdisciplinary Research at the University of Bielefeld, West Germany. The goal of this conference was to bring together researchers from all over the world to share information about a major aquatic sensory system, the evolution and function of which have largely remained an enigma since the 18th century. The "lateral line" or "lateralis" system has been used as an umbrella term to describe what originally (without the aid of modern anatomical techniques) looked like a series of pits, grooves, and lines on the head and trunk of fishes and some amphibians. For at least the past 30 years, however, it has been recognized that the lateralis system comprises not one, but at least two functional classes of receptors: mechanoreceptors and electroreceptors. The relative ease with which the appropriate stimulus could be defined and measured for the electroreceptive class has resulted in an explosion of information on this submodality during the past 20 years. As a result, there is little ambiguity about the overall function of the electrosensory system, now generally regarded as an independent system in its own right. A similarly clear definition for the function of the mechanosensory lateralis system has not been as forthcoming.

From the Introduction by Theodora Kroeber, Editor: The number of documents having to do with Ishi is finite. For the reader who wishes to know something of the sources from which the story flows, there are reproduced here the principal out-of-print and most inaccessible primary materials on Ishi and the Yahi Indians. Of first importance are monographs on Ishi, his people, his languages, his medical history, whose authors are Professors Thomas T. Waterman, Alfred L. Kroeber, Edward Sapir, and Saxton T. Pope, M.D. Most of these monographs are here reprinted in full. Next in interest and importance are the books of reminiscences concerning the Yahi Indians written by white settlers in or adjacent to Yahi country in the years following closely upon the gold rush. These are usually in small editions, long out of print. Two, those written by Carson and R. A. Anderson, are reprinted in full; the others, only those parts having to do with Ishi and the Yahi. There are letters bearing on our subject, newspaper accounts, and pictures, of which we include significant examples. There are as well books and articles having to do only in part with Ishi and his people. We reprint only those parts. Beyond these essential primary materials, the editors made hard choices to keep the number of pages realistic. Readers with areas of special interest will regret some of our exclusions among the secondary but often fascinating accounts: of archaeological findings in the Yahi homeland of linguistic quirks and grammatical technicalities--a large literature, difficult for the uninitiate; of medical history when it adds nothing to our understanding of the man Ishi. Our order of presentation is chronological, beginning with the background materials, then going to Ishi's first entry into the outside world, then to his years at the museum, and, finally, to his death. We have not included the occasional newspaper stories of still-living Yahi Indians supposed to have been seen or heard in the Yahi hills and caves after Ishi's departure, since none were ever substantiated. When in 1914 Ishi returned to his old home for a few weeks with Waterman, Kroeber, Pope, and Pope's son, Saxton, Jr., he found the land, the caves, and the village sites as he had left them.

Any overview of prehispanic society in the Americas would identify its obsidian core-blade production as a unique and highly inventive technology. Normally termed prismatic blades, these long, parallel-sided flakes are among the sharpest cutting tools ever produced by humans. Their standardized form permitted interchangeable use, and such blades became the cutting tool of choice throughout Mesoamerica between 600-800 B.C. Because considerable production skill is required, increased demand may have stimulated the appearance of craft specialists who played an integral role in Mesoamerican society. Some investigators have argued that control over obsidian also had a significant effect on the development and organization of chiefdom and state-level societies. While researchers have long recognized the potential of obsidian studies, recent work has focused primarily on compositional analysis to reconstruct trade and distribution networks. Study of blade production has received much less attention, and many aspects of this highly evolved craft are still lost. This volume seeks to identify current research questions in Mesoamerican lithic technology and to demonstrate that replication studies coupled with experimental research design are valuable analytical approaches to such questions.

Written in 1595, Fray Mendieta's work presents the history of the advent of Christianity in the Caribbean and Mexican regions as a consequence of the Spanish conquest. He illustrates the triumph and tragedy of the missionary effort and the difficulties in the conversion of the Indians, conflicts between spiritual ends and material interests. This edition of translated sections also presents some translated sections from Mendieta's letters, including a letter addressed to King Philip II of Spain.

In Mordin On Time, Nick Mordin sets out his method for answering the most fundamental question facing punters in any race, namely: which is the fastest horse? He was timing the sections of races with a stop watch, estimating wind strength and direction, adjusting for movements of running rails, using projected times and calculating average times years before the best-selling American books on speed rating were published. This new edition incorporates much new material, including standard times for all Irish racecourses (plus the major French ones). Mordin On Time enables the reader to construct their own speed ratings wherever they live.

Electroreception Edited by Theodore Holmes Bullock and Walter Heiligenberg Presents recent findings in the research on modality of animal perception, particularly the ability to sense feeble electrical fields. Includes a new treatment of electric organs and their control, examination of receptors and their ionic mechanisms, and discussion of regeneration of the spinal cord. Uses electric fish as models. 1986 (0 471-81800-3) 722 pp. Neurobiology of Taste and Smell Thomas E. Finger and Wayne L. Silver A survey of subdisciplines within the field of neurobiology and an overview of current issues, recent findings, and future research, and an excellent introduction to the specific study of the chemical senses, including olfactory, vomeronasal, and gustatory systems. 1987 (0 471-81799-6) 449 pp. Higher Brain Functions Recent Explorations of the Brain's Emergent Properties Edited by Steven P. Wise Pushing at the frontiers of knowledge, the best minds in the field of neurophysiology develop original ideas first presented in a monograph by Evarts, Shinoda, and Wise, Neurophysiological Approaches to Higher Brain Functions. Organized into three sections, Motor Aspects of Higher Brain Function, Effects of Preparatory Set, and Cerebral Organization, this volume explores important and interesting research directed toward questions concerning higher brain functions that lie beyond the traditional concerns of sensor and motor physiology. 1987 (0 471-01111-8) 384 pp. Synaptic Function Edited by Gerald M. Edelman, W. Einar Gall, and W. Maxwell Cowan Examines synaptic function by focusing on five areas--biochemical and biophysical mechanisms of change in pre-and postsynaptic cells; the neurochemistry of transmitters and their release; the interactions of cells in small networks; synaptic plasticity related to long-term changes; and theoretical models of synaptic function. 1987 (0 471-85557-X) 944 pp.

The volume about Avatamsaka Buddhism in East Asia is the result of a symposium organized in France in 2008. 15 contributions reflect the ways of manifestation and of expression of Huayan doctrines in several geographical regions and at different periods. Compared with previous valuable studies, the present volume intends to open broader perspectives, to give the opportunity to develop opened problematics, based on primary sources, textual and iconological. The Avatamsaka doctrines have developed particular ways of expression and paradigms on the Chinese soil, as a sinized Buddhism, they may be said to have achieved a philosophical revolution in the history of Mahayana: the Absolute is not the goal of the philosophical and soteriological inquiry, but its point of departure. The world is not only an illusion to be transcended but a manifestation of this very Absolute. The Avatamsaka can be seen as the backbone of influential currents, the Chan or Zen, the Tiantai or Tendai, the Ritualistic Buddhism, the Pure Land teachings, as well as the Song studies. The renewal of problematics on history of religion in the Far East region, as the so-called combined scheme simultaneously philosophical (exoteric) and ritualist (esoteric), gives a meaning to the approach of Avatamsaka current as common denominator linked from China till the Qitan region to Korea and Japan.

Korean: A Comprehensive Grammar is a reference to Korean grammar, and presents a thorough overview of the language, concentrating on the real patterns of use in modern Korean. The book moves from the alphabet and pronunciation through morphology and word classes to a detailed analysis of sentence structures and semantic features such as aspect, tense, speech styles and negation. Updated and revised, this new edition includes lively

descriptions of Korean grammar, taking into account the latest research in Korean linguistics. More lower-frequency grammar patterns have been added, and extra examples have been included throughout the text. The unrivalled depth and range of this updated edition of Korean: A Comprehensive Grammar makes it an essential reference source on the Korean language.

Celebrate your year the right way with this wonderful line notebook with matte cover. This travel-friendly book is perfect to take with you for all your multi-purpose writing needs and makes a great practical gift for any person celebrating their birthday.

Human development is a long and steady process that began with stone tool making. Because of this skill, humans were able to adapt to climate changes, discover new territories, and invent new technologies. "Pressure knapping" is the common term for one method of creating stone tools, where a larger device or blade specifically made for this purpose is used to press out the stone tool. Pressure knapping was invented in different locations and at different points in time, representing the adoption of the Neolithic way of life in the Old world. Recent research on pressure knapping has led for the first time to a global thesis on this technique. The contributors to this seminal work combine research findings on pressure knapping from different cultures around the globe to develop a cohesive theory. This contribution to this volume represents a significant development to research on pressure knapping, as well as the field of lithic studies in general. This work will be an important reference for anyone studying the Paleolithic, Mesolithic, and Neolithic periods, lithic studies, technologies, and more generally, cultural transmission.

The incidence of existing marine fauna by latitude and depth is recorded for the Eastern Pacific Ocean and offshore islands. Hypotheses concerning long and short term factors influencing the coast-wide distribution of the bivalve fauna are formulated and examined. Consideration is given to global effects of plate tectonics, continental displacement and environmental factors. Ordination and clustering techniques are used to examine the size and distribution of zoogeographic provinces. Provincial boundaries are presented and the characteristics of these provinces are described.

The research attempts to bridge the existing gap between the naturalistic observations of sound communication in anurans and the anatomical and physiological findings in their auditory nervous system. The motivation for this research concerns the author's interest in the neural representation of complex meaningful sounds - stimuli for which the nervous system is presumably designed to process. Such a representation, although suggested by electrophysiological recordings of patterns of activity in various neural centers, requires a behavioral confirmation that these, in fact, are the principles by which information is processed within the intact animal. To this end, vocal behavior has been evoked from the males of laboratory colonies of bullfrogs (*Rana catesbeiana*) in response to a restricted class of natural and synthetic sounds. The evoked vocal responses, having the signal characteristics of the bullfrog's mating call, were highly selective. To playback of the mating calls of 34 different species of frogs and toads, only the mating calls of certain male bullfrogs would evoke calling from the laboratory animals. By employing a standardized experimental technique, quantitative measures of evoked calling have been obtained for a large number of synthesized bullfrog mating calls.

Japan's greatest seer, the blind prophet Hinoto, has foretold the end of the world. At the center of her prophecy is a young man named Kamui Shiro, who possesses startling psychic powers. Although Kamui's future seems to have been predetermined from his birth, he has a choice--save the earth, or destroy it.

The subcommissural organ is a secretory ependymo-glial structure of the brain. It secretes glycoproteins into the cerebrospinal fluid. The chemical nature of this material is only partly known, and the functional role of the entire circumventricular complex has remained enigmatic. New experimental models include transplantation, immunological blockade, and experimental and clinical hydrocephalus. This first book in the field containing provocative ideas will most likely stimulate further investigations into molecular and systemic aspects of the problem.

In review, the amount of information available on the morphological and functional properties of the frog nervous system is very extensive indeed and in certain areas is the only available source of information in vertebrates. Further more, much of the now classical knowledge in neurobiology was originally obtained and elaborated in depth in this vertebrate. To cite only a few examples, studies of nerve conduction, neuromuscular transmission, neuronal integration, sense organs, development, and locomotion have been developed with great detail in the frog and in conjunction provide the most complete holistic description of any nervous system. Added to the above considerations, the ease with which these animals may be maintained (both as adults and during development) and the advantage of their lower cost as compared with other vertebrate forms make the frog one of the most important laboratory animals in neurobiology. With these thoughts in mind, we decided to compile this volume. Our goal in doing so was to assemble as much as possible of the information available on frog neurobiology and to have the different topics covered by authorities in each of the fields represented. To keep the handbook restricted to one volume, we found it necessary to omit the large field of amphibian muscle neurobiology, which has already been summarized in various other publications.
