Optical lens design is the process of designing a lens to meet a set of performance requirements and constraints, including cost and manufacturing limitations. Parameters include surface profile types (spherical, aspheric, holographic, diffractive, etc.), as well as radius of curvature, distance to the next surface, material type and optionally tilt and decenter.

A progressive addition lens (or "PAL") is a type of multifocal lens that employs a surface with a continuously smooth increase in addition (Plus) power. The curvature of the surface increases from its minimum value in the distance zone to its maximum value in the near zone (Figure 1). The total increase in surface power between these two zones is equal to the specified Add power of the lens.

Lens Design Fundamentals by Kingslake, Rudolf (ebook)

Lens Design Fundamentals, Second Edition, is the most comprehensive treatise to be published on the subject of Lens Design. This book holds a unique place in the optics literature. It adds impressive building blocks to the foundation established by A. E. Conrady in "Applied Optics and Optical Design" and Rudolph Kingslake in "Lens Design Fundamentals, First Edition".

Rudolf Kingslake, R. Barry Johnson, in Lens Design Fundamentals (Second Edition), 2010. 2.1.1 Object and Image. All lens design procedures are based on the principles of geometrical optics, which assumes that light travels along rays that are straight in a homogeneous medium. Light rays are refracted or reflected at a lens or mirror, where they proceed to form an image.
