Linear Algebra Recap — Image Processing and Computer

Through the use of Linear Algebra and other mathematical models, the field of Computer Vision has expanded rapidly. Currently, Computer Vision is used to solve vital problems in a vast array of fields including medical imaging, surveillance, face and object detection and identification.

Eigenvectors and eigenvalues have many important applications in computer vision and machine learning in general. Well known examples are PCA (Principal Component Analysis) for dimensionality reduction or EigenFaces for face recognition. An interesting use of eigenvectors and eigenvalues is also illustrated in my post about error ellipses.

...

In computer vision, linear algebra is used in applications such as image recognition, some image processing techniques including image convolution and image representation as tensors — or as we call them in linear algebra, vectors \mathbf{v} .

An expression such as $x_1 u + x_2 v + x_3 w$ where u, v, w are vectors and the x_i s are scalars (in \mathbb{R}) is called a linear combination. Using this notion, the problem of solving our linear system $x_1 u + x_2 v + x_3 w = b$. is equivalent to determining whether b can be expressed as a linear combination of u, v, w .

A set of linear equations and represented with $(A \setminus v = \setminus v b)$ thus has a solution $(\setminus v x = A \setminus \text{inv} \setminus v b)$. Please note that solving a set of linear equation by calculating the inverse matrix is not a wise thing to do. Better ways to solve such a system are known and available in most linear algebra packages.

The first topic is called A New Way to Start Linear Algebra. The key point is to start right in with the columns of a matrix A and the multiplication Ax that combines those columns. That leads to The Column Space of a Matrix and the idea of independent columns and the factorization $A = CR$ that tells so much about A .
