There is as yet no viable long-term strategy to ensure that digital information will be readable in the future. Digital documents are vulnerable to loss via the decay and obsolescence of the media on which they are stored, and they become inaccessible and unreadable when the software needed to interpret them, or the hardware on which that software runs, becomes obsolete and is lost. This report explores the technical depth of the problem of long-term digital document preservation, analyzes the inadequacies of a number of ideas that have been proposed as solutions, and elaborates the emulation strategy. The central idea of the emulation strategy is to emulate obsolete systems on future, unknown systems, so that a digital document's original software can be run in the future despite being obsolete. Contents of this report are as follows: (1) Introduction (stating the digital preservation problem and introducing the emulation strategy); (2) The Digital Longevity Problem; (3) Preservation in the Digital Age; (4) The Scope of the Problem; (5) Technical Dimensions of the Problem; (6) The Inadequacy of Most Proposed Approaches; (7) Criteria for an Ideal Solution; (8) The Emulation Solution; (9) Research Required for the Emulation Approach; and (10) Summary. Seventy-five percent of processed foods on supermarket shelves—from soda to soup, crackers to condiments—contain genetically engineered ingredients. The long-term effects of these foods on human health and ecology are still unknown, and public concern has been steadily intensifying. This new book from the Council for Responsible Genetics gathers the best, most thought-provoking essays by the leading scientists, science writers, and public health advocates. Collectively, they address such questions as: Are GM foods safe and healthy for us? Will GM food really solve world hunger? Who really controls the power structure of food production? Are GM foods ecologically safe and sustainable? Why is it so difficult to get GM foods labeled in the US? What kinds of regulations and policies should be instituted? How is seed biodiversity, of lack thereof, affecting developing countries? Should animals be genetically modified for food? How are other countries handling GM crops? Ultimately, this definitive book encourages us to think about the social, environmental, and moral ramifications of where this particular branch of biotechnology is taking us, and what we should do about it.

Rivers of Light draws deeply on the ancient Chinese teachings of the Five Elements, guiding the reader through a personal wisdom journey of awakening and understanding. The teachings of the Five Elements describe our intimate connection to the laws, cycles and movements of nature, showing how all the Five Elements of the natural world live and work within each of us. However, we have an essential relationship with just one element, which plays out through a person's life and has a central role in all aspects of health, from the physical to the emotional, mental and spiritual. The author interprets this elemental relationship as karmic. She invites the reader to take a personal voyage as the book moves through the challenging shadowlands of stressful and difficult times that we all encounter, to lighter and blissful realms of higher consciousness, or the domain of the soul. Using meditations, affirmations and colourful descriptions alongside the text, the reader is drawn into a fascinating world of discovery, to answer the deeper questions that we all meet as we move through life: 'Why do I feel as I do?' 'Who am I really?' 'What am I here to learn or to understand?' To know ourselves on a profound level is perhaps more urgent than ever before, as we come face to face with uncertainty in this rapidly changing world.

The legacy of Leo Hendrik Baekeland and his development of phenol formaldehyde resins are recognized as the cornerstone of the Plastics Industry in the early twentieth century, and phenolic resins continue to flourish after a century of robust growth. On July 13, 1907, Baekeland filed his "heat and pressure" patent related to the processing of phenol formaldehyde resins and identified their unique utility in a plethora of applications. The year 2010 marks the Centennial Year of the production of phenolic resins by Leo Baekeland. In 1910, Baekeland formed Bakelite GmbH and launched the manufacture of phenolic resins in Erkner in May 1910. In October 1910, General Bakelite began producing resins in Perth Amboy, New Jersey. Lastly, Baekeland collaborated with Dr. Takamine to manufacture phenolic resins in Japan in 1911. These events were instrumental in establishing the Plastics Industry and in tracing the identity to the brilliance of Dr. Leo Baekeland. Phenolic resins remain as a versatile resin system featuring either a stable, thermoplastic novolak composition that cures with a latent source of formaldehyde (hexa) or a heat reactive and perishable resole composition that cures thermally or under acidic or special basic conditions. Phenolic resins are a very large volume resin system with a worldwide volume in excess of 5 million tons/year, and its growth is related to the gross national product (GNP) growth rate globally.
