Until relatively recently, adult learning in the UK was largely recognised as being situated mainly within the LEA adult education centre, university extra-mural departments and the WEA. However, this picture has changed. The major change has been a shift from 'education' to 'learning' as the key organising concept. A greater range of settings are now recognised as sites producing learning,

and alongside this has grown a debate about the purpose and form of study within adult learning. This has led people to question both the concept of adult learning and the boundaries of its provision. This book reviews and assesses the changes which are taking place. It explores the disputes surrounding adult learning, discussing how boundaries have blurred thereby creating new opportunities such as APL and credit transfer, and including a significantly wider range of activities within the definition of learning. It also assesses the extent to which, despite the changes in boundaries, inequalities in learning opportunities still persist.

Workflow-based Process Controlling Systems provide companies with the ability to measure the operational performance of their business processes in a timely and accurate fashion. The combination of workflow audit trails with data warehouse technology and operational business data allows for complex analyses that can support managers in their assessment of an organization's performance. The increasing maturity of business process management and data warehouse systems enables the design and development of advanced process-oriented management information systems. Michael zur Muehlen discusses the integration of workflow audit trail data with existing data warehouse structures and develops a reference architecture for process-oriented management information systems. Starting with an organizational and technical analysis of process organizations, this book provides a comprehensive documentation of business process management, workflow technology, and existing standardization efforts. The proposed reference architecture is validated in an industry context. A prototypical implementation of the reference architecture and its integration with a commercial business process management system are demonstrated as well. This book is directed at both practitioners and academics in the fields of business process management, management accounting, and information systems research.

This book reassesses this question by exploring Germany's division after the Second World War from the point of view of the SED, the communist-led and Soviet-sponsored ruling party of East Germany. Drawing on unpublished documents from the SED archives, Dr Spilker rejects claims that the East German comrades and their Soviet masters had abandoned their struggle for socialism and were willing to accept a democratic Germany in exchange for a pledge to neutrality. He argues that the communists' sudden switch to a multi-party approach at the end of the war was a tactical move inspired not by a desire for compromise but by the mistaken belief that they could win political hegemony - and the chance to introduce socialism throughout Germany - through the ballot box. Communist optimism, as this book shows, rested on specific assumptions about the situation after the war, all of which revolved around the prospect of political instability and social unrest in West Germany. The comrades in East Berlin did not just say that their regime would ultimately prevail, they genuinely believed it. Nor should their hopes be dismissed as a mere fantasy. In the aftermath of the war, the economic gap between the two Germanies was still relatively narrow and West Germany's future success as a magnet for the people in East Germany was by no means guaranteed.

Statistics and Probability for Engineering Applications provides a complete discussion of all the major topics typically covered in a college engineering statistics course. This textbook minimizes the derivations and mathematical theory, focusing instead on the information and techniques most needed and used in engineering applications. It is filled with practical techniques directly applicable on the job. Written by an experienced industry engineer and statistics professor, this book makes learning statistical methods easier for today's student. This book can be read sequentially like

a normal textbook, but it is designed to be used as a handbook, pointing the reader to the topics and sections pertinent to a particular type of statistical problem. Each new concept is clearly and briefly described, whenever possible by relating it to previous topics. Then the student is given carefully chosen examples to deepen understanding of the basic ideas and how they are applied in engineering. The examples and case studies are taken from real-world engineering problems and use real data. A number of practice problems are provided for each section, with answers in the

back for selected problems. This book will appeal to engineers in the entire engineering spectrum (electronics/electrical, mechanical, chemical, and civil engineering); engineering students and students taking computer science/computer engineering graduate courses; scientists needing to use applied statistical methods; and engineering technicians and technologists. * Filled with practical techniques directly applicable on the job * Contains hundreds of solved problems and case studies, using real data sets * Avoids unnecessary theory
