Master Slave Control Of Interline Power Flow Controller

Master/slave is a model of communication for hardware devices where one device has a unidirectional control over one or more devices. This is often used in the

electronic hardware space where one device acts as the controller, whereas the other devices are the ones being controlled. In short, one is the master and the others are slaves to be controlled by the master.

What is Master/Slave? - Definition from Techopedia

Master/slave is a model of asymmetric communication or control where one device or process (the "master") controls one or more other devices or processes (the "slaves") and serves as their communication hub. In some systems a master is selected from a group of eligible devices, with the other devices acting in the role of slaves. Historically, the master/slave terminology has existed for ...

Master/slave (technology) - Wikipedia

master: A master, in a technological context, is a device that controls one or more other devices. In networking, for example, a master/slave configuration is a communications model in which one device or process (known as the master) controls one or more other devices or

processes (known as slaves).

Master-slave terminology alternatives you can use right now

Many masters control their slaves in this way such as a master called Vadius Pollio, who Seneca tells us ordered a slave to be fed to his fish simply for breaking a crystal cup. However, take note...

Cascade Temperature Control System. Cascade control systems (also called two-element control systems) have two control "loops" functioning: a master and a slave (also known as primary and secondary, respectively). Identify the master (primary) and slave (secondary) loops in this temperature control system, and also determine which loop should be tuned first

(and why!).
