Near Field Communication (NFC) is a set of standards for smartphones and similar devices to establish radio communication with each other by touching them together, or bringing them in close proximity with each other, usually no more than a few inches/centimeters.

### Near Field Communication: What is Near Field Communication?

Near Field Communication allows a device to send small pieces of data when in close proximity to other NFC devices. NFC hardware is required for this communication. On Windows 10 IoT Core, you can communicate with the hardware manually by using the GPIO, I2C or SPI APIs, or you can use the SmartCard APIs if a driver is associated with the hardware.

### What is NFC? Near Field Communication Explained

Near Field Communication (NFC) is a short-range wireless connectivity standard (Ecma-340, ISO/IEC 18092) that uses magnetic field induction to enable communication between devices when they're touched together, or brought within a few centimeters of each other. Jointly developed by Philips and Sony, the standard specifies a way for the devices to establish a peer-to-peer (P2P) network to ...

Near field communication, abbreviated NFC, is a form of contactless communication between devices like smartphones or tablets. Contactless communication allows a user to wave the smartphone over a NFC compatible device to send information without needing to touch the devices together or go through multiple steps setting up a connection.

The automotive Near Field Communication (NFC) market is rapidly emerging, driven by combined forces of the NFC-enabled mobile device growth and new automotive service trends such as car sharing, corporate fleet management, Bluetooth and Wi-

Fi pairing, and the demand for personalization inside cars.
