tumors. CONCLUSION: Conjunctival tumors were of melanocytic origin in 53% of cases and nonmelanocytic origin in 47%. Overall, melanocytic tumors, epithelial tumors, and lymphoid tumors accounted for 74% of all cases. These tumors were far more common in Caucasian patients, and epithelial tumors were found more frequently in men.

Malignant tumor was 1.03% (one tumor) and benign tumors were 98.97% (96 tumors) of all. The most frequent non-melanocytic skin tumor was pilomatricoma with 22 lesions (22.68%), followed by pyogenic granuloma with 18 lesions (18.54%), and nevus sebaceous with 10 (10.3%) lesions.

Dermoscopy is useful to distinguish pigmented non-melanocytic lesions from benign and malignant melanocytic lesions. There are specific features that help to distinguish these. Careful observation has resulted in the description of the dermoscopy of many non-pigmented lesions as well, which may be sometimes helpful in diagnosis for an itchy rash.

Non-melanocytic skin cancers (NMSC), also known as keratinocyte carcinomas, are cancers of the epithelial layer (epidermis). They are more common than melanoma, with incidence of NMSC in Australia more than five times the incidence of all other cancers combined in 2002, the highest in the world.

Non-melanoma skin cancer refers to a group of cancers that slowly develop in the upper layers of

the skin. The term non-melanoma distinguishes these more common types of skin cancer from the

less common skin cancer known as melanoma, which can be more serious. In the UK, around

147,000 new cases of non-melanoma skin cancer are diagnosed each year.

Non-melanoma skin cancer - NHS

Benign melanocytic lesions. Created 2008. Learning objectives. Describe and name common

benign melanocytic lesions (moles and freckles); Introduction. In the embryo, melanocytes are

derived from stem cells in the neural crest that normally migrate to the epidermis, where they are

scattered along the basal layer. Melanocytes produce melanin within cytoplasmic packets called

melanosomes.
