Peter Senge, founder and director of the Society for Organizational Learning and senior lecturer at MIT, has found the means of creating a 'learning organisation'. In *The Fifth Discipline*, he draws the blueprints for an organisation where people expand their capacity to create the results they truly desire, where new and expansive patterns of thinking are nurtured, where collective aspiration is set free, and where people are continually learning together. *The Fifth Discipline* fuses these features together into a coherent body of theory and practice, making the whole of an organisation more effective than the sum of its parts. Mastering the disciplines will: *Reignite the spark of learning, driven by people focused on

what truly matters to them. *Bridge teamwork into macro-creativity. *Free you from confining assumptions and mind-sets. *Teach you to see the forest and the trees. *End the struggle between work and family time. *The Fifth Discipline* is a remarkable book that draws on science, spiritual values, psychology, the cutting edge of management thought and Senge's work with leading companies which employ Fifth Discipline methods. Reading it provides a searching personal experience and a dramatic professional shift of mind. This edition contains more than 100 pages of new material about how companies are actually using and benefiting from Fifth Discipline practices, as well as a new foreword from Peter Senge about his work with the Fifth Discipline over the last 15 years.

The classic work on the evaluation of city form. What does the city's form actually mean to the people who live there? What can

the city planner do to make the city's image more vivid and memorable to the city dweller? To answer these questions, Mr. Lynch, supported by studies of Los Angeles, Boston, and Jersey City, formulates a new criterion—imageability—and shows its potential value as a guide for the building and rebuilding of cities. The development of resistance to pesticides is generally acknowledged as one of the most serious obstacles to effective pest control today. Since house flies first developed resistance to DDT in 1946, more than 428 species of arthropods, at least 91 species of plant pathogens, five species of noxious weeds and two species of nematodes were reported to have developed strains resistant to one or more pesticides. A seminar of U. S. and Japanese scientists was held in Palm Springs, California, during December 3-7, 1979, under the U. S. -Japan Cooperative Science Program, in order to evaluate the status of research on resistance and to discuss directions for future emphasis. A total of 32 papers were presented under three principal topics: Origins and Dynamics of Resistance (6), Mechanisms of Resistance (18), and Suppression and Management of Resistance (8). The seminar was unique in that it brought together for the first time researchers from the disciplines of entomology, plant pathology and weed science for a comprehensive discussion of this common problem. Significant advances have been identified in (a) the development of methods for detection and monitoring of resistance in arthropods (electrophoresis, diagnostic dosage tests) and plant pathogens, (b) research on biochemical and physiological mechanisms of resis

tance (cytochrome p450, sensitivity of target site, gene regulation), (c) the identification and quantification of biotic, genetic and operational factors influencing the evolution of resistance, and (d) the exploration of pest management approaches incorporating resistance-delaying measures.
