Consider fluid flowing through a circular pipe of constant radius as illustrated below. The figure is not to scale. The pipe diameter  $D = 0.2$  m and length  $L = 3$  m Consider the inlet velocity to be constant over the cross-section and equal to 1 m/s. The pressure at the pipe outlet is 1 atm.

How can I conduct vibration analysis for exhaust pipe line using ansys? ... I have modeled a sample of exhaust pipe line and conducted modal analysis in ANSYS and found out the forces reaction and ...

Excessive vibration levels usually occur when a mechanical natural frequency of the piping system is excited by some pulsation or mechanical source. The vibration mode shapes usually involve lateral vibrations and/or shell wall radial vibrations.

A pipe stress analysis (thermal flexibility analysis) predicts stresses in piping and loads on equipment resulting from thermal gradients, thermal transients, weights, pressure, and bolt-up strain. This study is typically required for piping that experiences high temperature fluctuations, or for long pipe runs such as hot piping to coolers or headers.
