Separation of the variable is done when the differential equation can be written in the form of $dy/dx = f(y)g(x)$ where f is the function of y only and g is the function of x only. Taking an initial condition, rewrite this problem as $1/f(y)dy = g(x)dx$ and then integrate on both sides. Also, check: Solve Separable Differential Equations Integrating factor technique is used when the differential ...

A variety of physical processes can be modelled as differential equations or control problems and understood by the analysis and computations of their solutions. For example, a spacecraft could be modelled as a dynamical system with controls corresponding to rocket thrusters, or the dynamical system could be a nation's economy and the controls in this case could be fiscal and monetary policy.
