This is linear power amplifier 2000 Watt which need advance knowledge in electronics since the schematic diagram is very complex for hand made circuit. I think you have to re-design the schematic diagram using circuit diagram software designer such as diptrace, eagle, expresspcb ect. The circuit is a simple two transistor pre-amplifier using a feedback loop for enhancing the amplification. Any music as we know is in the form of a consistently varying frequency, therefore when such a varying input is

applied across the indicated C1 end terminals, the same is delivered across the base T1 and ground.

This circuit is of an 2x 2,500W RMS stereo amplifier, super-light and without switching-mode power supply. The circuit just shows a channel, and the power supply that it assists to the two channels. The audio circuit should be duplicated, but the power supply assists to the two channels without problems.
