For undergraduate courses in Human-Factors Engineering, Human-Computer Interaction, Engineering Psychology, or Human-Factors Psychology. Offering a somewhat more psychological perspective than other human factors books on the market, this text describes the capabilities and limitations of the human operator-both physical and mental-and how these should be used to guide the design of systems with which people interact. General principles of human-system interaction and design are presented, and included are specific examples of successful and unsuccessful interactions. It links theories of human performance that underlie the principles with real-world experience, without a heavy engineering-oriented perspective.

Drawing Futures brings together international designers and artists for speculations in contemporary drawing for art and architecture. Despite numerous developments in technological manufacture and computational design that provide new grounds for designers, the act of drawing still plays a central role as a vehicle for speculation. There is a rich and long history of drawing tied to innovations in technology as well as to revolutions in our philosophical understanding of the world. In reflection of a society now underpinned by computational networks and interfaces allowing hitherto unprecedented views of the world, the changing status of the drawing and its representation as a political act demands a platform for reflection and innovation. Drawing Futures will present a compendium of projects, writings and interviews that critically reassess the act of drawing and where its future may lie. Drawing Futures focuses on the discussion of how the field of drawing may expand synchronously alongside technological and computational developments. The book coincides with an international conference of the same name, taking place at The Bartlett School of Architecture, UCL, in November 2016. Bringing together practitioners from many creative fields, the book discusses how drawing is changing in relation to new technologies for the production and dissemination of ideas.

Excerpt from Descriptive Geometry for Students of Engineering In Fig. 2a we see the planes of projection, the hexagonal pyramid, and the projections of the outlines of the pyramid on the planes, as in a picture. All is shown as one complete view, such as we see when several sides of an object we are looking at are seen from a single viewpoint. If, however, the eye is moved so that we see only one projection at a time, a set of three different views would be obtained, called orthographic projections. By the methods of orthographic projection, these views would be arranged as in Fig. 2b. In this latter figure, a horizontal line is first drawn to represent the X axis, usually near the middle of the space to be taken for the drawing. Then at right angles to this line the Y and Z axes are drawn as shown. To represent by this method the views shown pictorially in Fig. 2a, the horizontal projection is drawn behind the X axis and on the left-hand side of the vertical Y axis. The front vertical projection is drawn below the X axis and vertically below the horizontal projection. The side vertical projection is also drawn below the X axis but on the other side of the Z axis. As the views are thus shown the horizontal projection shows the outlines of the pyramid when the eye is immediately over the horizontal plane. The front and side vertical projections represent the outlines as they appear when the eye is moved in front of the front and side vertical planes. This is a very convenient way to arrange the projections of an object, and it has the advantage that it is more easily understood by mechanics of ordinary ability, than some other arrangements of the same projections that will be discussed later.
