Psychiatric genetics is a subfield of behavioral neurogenetics and behavioral genetics which studies the role of genetics in the development of mental disorders. The basic principle behind psychiatric genetics is that genetic polymorphisms are part of the causation of psychiatric disorders. Psychiatric genetics is a somewhat new name for the old question, "Are behavioral and psychological conditions and deviations inherited?". The goal of psychiatric genetics is to better understand the causes o

Psychiatric genetics - Wikipedia

Psychiatric Genetics seeks to identify the common and rare genetic variants that underlie major mental illness, learning disability and related traits such as temperament, brain structure and function. We then use these variants to better understand the mechanisms of mental disorder through the development of human, non-human and cellular models of these disorders.
