QMake relies on a simple text file (" defs.mk ") being present in each directory of the project. Each defs.mk contains a set of variables that describe what must be compiled from that directory. Information describing the many variables in the defs.mk file for controlling what is built is given under Description File Variables.

For the standard installation of the Qt 5 repository (qt5.git), once Qt is built and installed, running make docs in the command line will build QDoc and the Qt 5 documentation set. The output will be located in qt5/qtbase/doc/ or to the directory set to qmake's QT_INSTALL_DOCS variable. cd qt5/ make docs

qmake Manual The qmake tool helps simplify the build process for development projects across different platforms. It automates the generation of Makefiles so that only a few lines of information are needed to create each Makefile. You can use qmake for any software project, whether it is written with Qt or not.

One way is to compile the documentation using QDoc and the configuration file (qdocconf) file. The other way is to use qmake by running "make docs". Section 1 Building the qdocconf File This method is useful for building separate projects without any dependencies to other projects.

qmake's fundamental behavior is influenced by variable declarations that define the build process of each project. Some of these declare resources, such as headers and source files, that are common to each platform; others are used to customize the behavior of compilers and linkers on specific platforms. Platform-specific variables follow the naming pattern of the variables which they ex-
