Automotive aerodynamics differs from aircraft aerodynamics in several ways. First, the characteristic shape of a road vehicle is much less streamlined compared to an aircraft. Second, the vehicle operates very close to the ground, rather than in free air. Third, the operating speeds are lower (and aerodynamic drag varies as the square of speed Aerodynamics is a significant factor in vehicle design, including automobiles, and in the prediction of forces and moments acting on sailing vessels. It is used in the design of mechanical components such as hard drive heads.
