In October 1993 the US Congress terminated the Superconducting Super Collider at the time the largest basic-science project ever attempted, with a total cost estimated to exceed \$10 billion. Its termination was a watershed event a pivot point not only in the history of physics but also for science in gen-

eral. "Tunnel Visions" follows the evolution of the endeavor from its origins in the Reagan Administration's military buildup of the early 1980s to its post-Cold War demise a decade later. The failure of the SSC raises the question of whether Big Science has become too big and expensive; can scientists and their government backers effectively manage such enormous undertakings? The case of the Super Collider offers important lessons about the conditions required to build and sustain a large scientific laboratory, and the rise and fall of the SSC also serves as a cautionary tale about the long-term viability of a research community that comes to depend as much as did US high-energy physics upon a single experimental facility of such an unprecedented scale. Riordan, Hoddson, and Kolb have written the definitive history of the SSC. "
