The United States has the highest per capita spending on health care of any industrialized nation but continually lags behind other nations in health care outcomes including life expectancy and infant mortality. National health expenditures are projected to exceed \$2.5 trillion in 2009. Given healthcare's direct impact on the economy, there is a critical need to control health care spending. According to The Health Imperative: Lowering Costs and Improving Outcomes, the costs of health care have strained the federal budget, and negatively affected state governments, the private sector and individuals. Healthcare expenditures have restricted the ability of state and local governments to fund other priorities and have contributed to slowing growth in wages and jobs in the private sector. Moreover, the number of uninsured has risen from 45.7 million in 2007 to 46.3 million in 2008. The Health Imperative: Lowering Costs and Improving Outcomes identifies a number of factors driving expenditure growth including scientific uncertainty, perverse economic and practice

incentives, system fragmentation, lack of patient involvement, and under-investment in population health. Experts discussed key levers for catalyzing transformation of the delivery system. A few included streamlined health insurance regulation, administrative simplification and clarification and quality and consistency in treatment. The book is an excellent guide for policymakers at all levels of government, as well as private sector healthcare workers.

Standard recommendations such as annual Pap smears for women and prostate tests for men over forty are in fact simply rules of thumb that ignore the complexities of individual cases and the tradeoffs between escalating costs and early detection, Russell argues. By looking beyond these recommendations to examine conflicting evidence about the effectiveness of screening tests, Russell demonstrates that medical experts' recommendations are often far simpler and more solid-looking than the evidence behind them. It is not at all clear, for example, that annual Pap smears are effective enough in reducing deaths from cervical cancer to justify the enormous additional costs involved in testing all women every year rather than every three years. Nor is there solid evidence for the value of prostate cancer screening, despite recommendations that all men over forty be tested annually.

This is the only text organized by risk factors - the same as those your patients present in the clinical setting. This valuable book reviews the recommendations from the newly revised U.S. Task Force 'Guide to Clinical Preventive Services' and provides step-by-step instructions on how to put prevention into your practice.

This paper reviews the evidence that elevation of serum cholesterol (hypercholesterolemia) is an independent risk factor for cardiovascular disease in the elderly and that the detection and treatment of hypercholesterolemia in an elderly individual who does not have clinically apparent heart disease will diminish overall morbidity or mortality.

The book provides guidance for conducting a well-woman visit, based on the American College of Obstetricians and Gynecologists Well Woman Task Force recommendations. The scope of problems, the rationale for screening or prevention, and the factors that alter screening are explained, then the recommendations are summarized, and advice is offered on their application.
