Testing should uncover software defects and improve software quality. Test team should focus on finding the defects in the software like any deviation from the software requirement specification (SRS) or any variance from the desired output. Also test team should focus on performance, reliability of software so as to improve software quality. 2.

### 7 Common Types of Software Testing [Complete Guide + FAQ]

Software testing is a process, to evaluate the functionality of a software application with an intent to find whether the developed software met the specified requirements or not and to identify the defects to ensure that the product is defect-free in order to produce the quality product.

The purpose of regression testing is to make sure the software doesn't regress in functionality. This is extremely important with Agile development methodologies where software is developed incrementally and there is a constant potential that adding new features could break existing ones. Most automated tests are regression tests.

What is test case execution? Test cases help guide the tester through a sequence of steps to... Automated Testing. ...

Software testers often have a good overarching knowledge of a product, including how the latest features or fixes will affect the product overall. Testers are also a good point of contact between managers, developers, operations, sysadmins, and other members of an organization which can be essential when coordinating releases.

In software testing, white box is a useful approach to simulating the activities of a user who has full knowledge of the internal operations of the target system. It allows the tester to have exhaustive access to all the application's inner details. This enables the tester to identify as many structural loopholes as possible.
