In general it is possible to choose M function evaluations per interval to obtain a formula exact for all polynomials of degree 2M-1 and less.. The Gauss Quadrature accurate to order 2M-1 may be determined using the same approach required for the two-point scheme. This may be derived by comparing the Taylor Series expansion for the integral with that for the points $x_0 + aDx$ and $x_0 + bDx$:

Function: allroots allroots (expr) allroots (eqn). Computes numerical approximations of the real and complex roots of the polynomial expr or polynomial equation eqn of one variable.. The flag polyfactor when true causes allroots to factor the polynomial over the real numbers if the polynomial is real, or over the complex numbers, if the polynomial is complex.

Parabolic partial differential equation - Wikipedia

In geology, numerical modeling is a widely applied technique to tackle complex geological problems by computational simulation of geological scenarios.. Numerical modeling uses mathematical models to describe the physical conditions of geological scenarios using numbers and equations. Nevertheless, some of their equations are difficult to solve directly, such as partial differential equations.
