Basic Concepts of Designing an RF PCB Board - EEWeb

When designing Printed Circuit Boards with RF components, a reliable ground layer should always be used. The goal is to establish an effective 0 V potential in the circuit, making all the components easy to decoupling. The 0 V terminal of the power supply should be connected directly to this ground layer.

We see, then, that RF design is not about merely generating EMR; rather, RF design is the art and science of generating and manipulating and interpreting EMR in a way that allows you to reliably transfer meaningful information between two circuits that have no direct electrical connection.

1) Surely use a multilayer PCB. If your PCB design includes only two layer, the top layer should include the power stage, RF signal lines and RF components. Then the bottom layer must be the ground plane. 2) The length of the lines that carry RF/Microwave signals is a very important issue. They should be at most 1/20 length of the wavelength.
