When the protein gramicidin is integrated into a membrane, an H⁺ channel forms and the membrane becomes very permeable to protons (H⁺ ions). If gramicidin is added to an actively respiring muscle cell, how would it affect the rates of electron transport, proton pumping, and ATP synthesis in oxidative phosphorylation?

Furthermore, considerable heterogeneity exists re-

garding the “question” used to elicit the effect and the variety of different types of target “behaviors” for which the effect has manifested. A meta-analytic synthesis of 104 question-behavior studies across 51 published and unpublished papers is presented.

Acetylcholine is the neurotransmitter used at the neuromuscular junction—in other words, it is the chemical that motor neurons of the nervous system release in order to activate muscles. This property means that drugs that affect cholinergic systems can have very dangerous effects ranging from paralysis to convulsions.

Growth hormone does seem to have a direct effect on bone growth in stimulating differentiation of chondrocytes. IGF-I is also a key participant of the muscle growth. It stimulates both the differentiation and proliferation of myoblasts (muscle cells), and amino acid uptake and protein synthesis in muscle and other tissues.
