A classic in the field, this third edition will continue to be the book of choice for advanced undergraduate and graduate-level courses in theories of human development in departments of psychology and human development. This volume has been substantially revised with an eye toward supporting applied developmental science and the developmental systems perspectives. Since the publication of the second edition, developmental systems theories have taken center stage in contemporary developmental science and have provided compelling alternatives to reductionist theoretical accounts having either a nature or nurture emphasis. As a consequence, a developmental systems orientation frames the presentation in this edition. This new edition has been expanded substantially in comparison to the second edition. Special features include: * A separate chapter focuses on the historical roots of concepts and theories of human development, on philosophical models of development, and on developmental contextualism. * Two new chapters surrounding the discussion of developmental contextualism--one on developmental systems theories wherein several exemplars of such models are discussed and a corresponding chapter wherein key instances of such theories--life span, life course, bioecological, and action theoretical ones--are presented. * A new chapter on cognition and development is included, contrasting systems' approaches to cognitive development with neo-nativist perspectives. * A more differentiated treatment of nature-oriented theories of development is provided. There are separate chapters on behavior genetics, the controversy surrounding the study of the heritability of intelligence, work on the instinctual theory of Konrad Lorenz, and a new chapter on sociobiology. * A new chapter concentrates on applied developmental science.

A perfect complement for the sociological theory course, it offers 13 original essays by leading scholars in the field who are also experienced undergraduate theory teachers. Substantial introductions by the editor link the applied essays to a complete review of the classical and modern social theories used in the book.

Intended for courses on theories of human development, this new text presents nine theories grouped into three major families - those that emphasize biological systems; those that emphasize environmental factors; and those that emphasize a dynamic interaction between biological and environmental forces. The nine theories selected have a long and productive history in human development and continue to evolve as a result of new insights. Grouping the theories by families enhances students' ability to think critically about theoretical ideas, assess the strengths and weaknesses of each theory, and gain a deeper understanding of how each theory guides research and application. The three families are introduced with a brief overview of the unique perspectives of each theory and the rationale for grouping these theories together. Discussion of each theory includes: the historical and cultural context in which the theory was developed; an overview of key concepts and important ideas; new directions in contemporary scientific work; a research example illustrating how the theory has been tested and modified; an application showing how the theory has guided the design of an intervention or program; an analysis of how the theory answers basic questions about human development; and a critique highlighting the theories' strengths and weaknesses. Theories of Human Development serves as a text in advanced undergraduate and/or beginning graduate courses in theories of human development. Its clear organization and engaging writing style make it accessible to students with a minimal background in human development.

This book fills the gap in the literature on nursing theories by presenting the background information on situation specific theories such as philosophical bases and current status of situation specific theories and providing a collection of situation specific theories that have been developed. It provides specific guidelines for nursing research and practice, essentials for PhD and DNP students to complete the requirements for their degrees (e.g., dissertation, QI project). In addition, this book can be used in theory courses in other graduate nursing programs that require theoretical bases for their comprehensive exam or scholarly project (e.g., MSN, NP). Throughout nursing history, nursing theories have evolved within the contexts of changing and emerging theoretical needs of nursing discipline. Subsequently, several different types of nursing theories have been proposed, developed, and used in nursing education, research, and practice. Situation specific theories could be easily adopted and used in nursing practice and research due to their foci on specific populations or particular fields. Since situation specific theories were firstly proposed in 1990s, they became a major part of nursing theories in the past two decades, making this book appeals to all levels of nursing students.
